8039. RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-13 23:33:09 UTC
From: Robert Carroll
Topic: 7992 Message: 8039

When my 565 was having bizarre VFO-B issues--basically the sub receiver was operational but could not be tuned-- Paul suspected the same thing. At the time he had a theory that connecting a computer to the Orion could cause VFO B lockup even if you never transmitted. I commented to him that if you couldn't connect a PC to the rig it wasn't of much use to me. Fortunately on an eventual return to TT he found it was a "synthesizer out of spec" problem--very painful to find.

Subject: RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

GOT ANOTHER QUESTION

Has anyone ever had RFI problems effect their rigs?? Sounds funny but Paul from TT answered an email about my VFO B issue and wanted to know if I would try it with a logging program connected. I disconnected the cable from the PC to the rig and operated "old school" no logging program and it ran for hours today with no illeffects. I did not do a lot of QSO's but I did do tests on several bands using the amp and all ok

I then connected the cable and loaded up DXLab, my current log choice, and at the onset both VFO's were ok. I got brave and decided to try a contact on 17m with the amp, BAM, VFO B is back to being locked in a some freq but the display can be changed. I'm not too sure if it went south as I changed bands to 17m but it was after making the contact, which was simplex BTW. My cable is a home made cable but it's been in use for over a few years, last year I added signal lines for my STEPPIR controller. I know it does it with DXLabs and Logger32. I have DXbase and HRD also and will try it with them

Also on my power switch, the new switch does not power the rig down, Paul says "Turn on problem: Probably a problem with the turn on circuit on the back panel board, sounds like a leaky transistor."

Thanks in advance

John

Subject: RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

An additional "FIND" with my VFO B issue.. What I found over the weekend is that VFO B does hear.. but on a reboot it hears on 14.035, the default frequency after a master reboot. No matter what band I tune to or tuning the VFO knob it's listening to 14.035. It just seemed like it was hearing nothing but I kept hearing a CW signal when I was in the phone band and finally found it. NOW the other scenario.. If I do a reset and the VFO B does work it's all good until it goes bad ;) then what ever frequency is in VFO B is stuck there. Example if I was working RTTY split and VFO B decides to stop working properly, that's the signal I keep hearing in VFO B. Again no change when I change bands or manually enter a frequency. I've gone back and put 2.063x and 2.062a in and the same issue. I cannot determine if there is any thing I'm doing to make this happen but running DXLab, FLDIGI and FLDIGI bridge, N8LP VCP on a XP PC .

Again others suggested a weak battery can cause strange issues but one was ordered Friday from TT but will not ship until today so I'll wait for that and see. I'll be replacing a bad power switch (rig won't power off with switch) and checking all the jumper cable connections when I get the covers off

If no fix is found..it's headed to TT HQ

Thanks

John

8041. RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-14 01:53:55 UTC
From: Wes Attaway (N5WA)
Topic: 7992 Message: 8041

This VFO-B problem is beginning to sound like something that has a number of different causes because different people seem to have found different reasons for it to occur and different ways to stop it. Either that or we have inaccurate reporting, but some of the reports are fairly detailed.

In my case, I have had the VFO-B non-receive problem with or without the logging software (DX4Win and microKeyer II) running and with or without ever transmitting. I have zero RFI in the shack, with a TV set, computers and other electronic gadgets sitting within two feet of the radio and showing zero ill effects. I do not run an amp. I doubt that in my case RFI is the problem.

For me, the cure is always the same ...Just turn the radio off and then turn it back on. Once I do this everything is normal (tending to rule out RFI), including hearing signals on VFO-B. The radio never misses a beat and all frequency settings, filter settings, etc, stay the same between the on-off-on cycles. My VFO-B non-receive problem is infrequent but I have never had it reoccur during the same operating session after going through the off-on cycle. I don't actually know how often the VFO-B problem occurs because the only time I use VFO-B is if I need to use "split" for DX and even then I don't always listen on VFO-B. The transmit function works on VFO-B even if the RX function is not working.

For the record, I am using the latest firmware and there was no change in the VFO-B problem as I went through various upgrades over the years. It is exactly the same problem now as it was several years ago.

All this makes me think that in my case the synthesizer explanation makes the most sense although I don't know why the off-on cycling "fixes" it for an entire operating session that may last for several days if I leave the radio on that long.

that turn it off and turn it back on fix is what I had here recently when my memory battery went out. easy to replace, remove top and bottom cases and loosen the front panel , it only goes in 1 way too. all kinds of weird problems , but a new battery fixed it. And fairly cheap too.. tom N6AJR

. Catfish. Both vfo's are on the speaker and when I use my headphones, almost 10% of the time I have MAIN in left and SUB in right and it's easy to tell when VFO B heads south.

. Wes.. I ran mine for a few hours this morning w/o a cable connecting the PC and not a problem one, but as soon as I connected a cable for the PC control.. VFO B went out.

Right now I'm really confused on what it does or does not :L So I will play with it more

It worked fine for a couple of years and now it starts. I just started using DXLab but I think this happened before I switched over. I do know this, I had a problem with one of my menu screens and even with 3.030 and using Logger32 I get that screen again (MENU-SSB), it's grabled.

As soon as the battery gets here, it's going in $9 from TT, hope it's here Thurs or Fri

. Bob, if the battery does not change anything or I can't find a solution I'll send it back. But Paul never mentioned that but others have

that turn it off and turn it back on fix is what I had here recently when my memory battery went out. easy to replace, remove top and bottom cases and loosen the front panel , it only goes in 1 way too. all kinds of weird problems , but a new battery fixed it. And fairly cheap too.. tom N6AJR

In a message dated 3/13/2012 6:54:23 P.M. Pacific Daylight Time, wesattaway@... <mailto:wesattaway%40bellsouth.net> <mailto:wesattaway%40bellsouth.net> writes:

This VFO-B problem is beginning to sound like something that has a number of
different causes because different people seem to have found different reasons for it to occur and different ways to stop it. Either that or we have inaccurate reporting, but some of the reports are fairly detailed.

In my case, I have had the VFO-B non-receive problem with or without the logging software (DX4Win and microKeyer II) running and with or without ever
transmitting. I have zero RFI in the shack, with a TV set, computers and other electronic gadgets sitting within two feet of the radio and showing zero ill effects. I do not run an amp. I doubt that in my case RFI is the problem.

For me, the cure is always the same ...Just turn the radio off and then turn
it back on. Once I do this everything is normal (tending to rule out RFI),
including hearing signals on VFO-B. The radio never misses a beat and all frequency settings, filter settings, etc, stay the same between the on-off-on cycles. My VFO-B non-receive problem is infrequent but I have never had it reoccur during the same operating session after going through the off-on cycle. I don't actually know how often the VFO-B problem occurs because the only time I use VFO-B is if I need to use "split" for DX and even then I don't always listen on VFO-B. The transmit function works on VFO-B even if the RX function is not working.

For the record, I am using the latest firmware and there was no change in the VFO-B problem as I went through various upgrades over the years. It is exactly the same problem now as it was several years ago.

All this makes me think that in my case the synthesizer explanation makes the most sense although I don't know why the off-on cycling "fixes" it for an entire operating session that may last for several days if I leave the radio on that long.

Over ...

GOT ANOTHER QUESTION

Has anyone ever had RFI problems effect their rigs?? Sounds funny but Paul from TT answered an email about my VFO B issue and wanted to know if I would
try it with a logging program connected. I disconnected the cable from the PC to the rig and operated "old school" no logging program and it ran for hours today with no illeffects. I did not do a lot of QSO's but I did do tests on several bands using the amp and all ok

I then connected the cable and loaded up DXLab, my current log choice, and at the onset both VFO's were ok. I got brave and decided to try a contact on
17m with the amp, BAM, VFO B is back to being locked in a some freq but the
display can be changed. I'm not too sure if it went south as I changed bands
to 17m but it was after making the contact, which was simplex BTW. My cable is a home made cable but it's been in use for over a few years, last year I added signal lines for my STEPPIR controller. I know it does it with DXLabs and Logger32. I have DXbase and HRD also and will try it with them

Also on my power switch, the new switch does not power the rig down, Paul says "Turn on problem: Probably a problem with the turn on circuit on the back panel board, sounds like a leaky transistor."

Thanks in advance

John

Subject: RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

An additional "FIND" with my VFO B issue.. What I found over the weekend is that VFO B does hear.. but on a reboot it hears on 14.035, the default frequency after a master reboot. No matter what band I tune to or tuning the
VFO knob it's listening to 14.035. It just seemed like it was hearing nothing but I kept hearing a CW signal when I was in the phone band and finally found it. NOW the other scenario.. If I do a reset and the VFO B does work it's all good until it goes bad ;) then what ever frequency is in VFO B is stuck there. Example if I was working RTTY split and VFO B decides to stop working properly, that's the signal I keep hearing in VFO B. Again no change when I change bands or manually enter a frequency. I've gone back and put 2.063x and 2.062a in and the same issue. I cannot determine if there is any thing I'm doing to make this happen but running DXLab, FLDIGI and FLDIGI bridge, N8LP VCP on a XP PC .

Again others suggested a weak battery can cause strange issues but one was ordered Friday from TT but will not ship until today so I'll wait for that and see. I'll be replacing a bad power switch (rig won't power off with switch) and checking all the jumper cable connections when I get the covers
off

If no fix is found..it's headed to TT HQ

Thanks

John

8045. RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-14 05:17:25 UTC
From: John Hudson
Topic: 7992 Message: 8045

I may have this issue narrowed down but here's what I can make it do.

If I have not logging program running (with cable connected) Both VFO's appear to work fine. I cannot make it go bad.

If I run dxBase and QSY by clicking on a dx spot, both VFO's appear to work

Same for Ham Radio Deluxe

But if I load DXLabs. It seems to be fine until I click on to a DX spot. I have made this go bad 4 times in a row NO TRANSMISSIONS WERE MADE

So I'm going to email Dave the author of DXLab and pick his brain

More to follow and thanks

John

. Catfish. Both vfo's are on the speaker and when I use my headphones, almost 10% of the time I have MAIN in left and SUB in right and it's easy to tell when VFO B heads south.

. Wes.. I ran mine for a few hours this morning w/o a cable connecting the PC and not a problem one, but as soon as I connected a cable for the PC control.. VFO B went out.

Right now I'm really confused on what it does or does not :L So I will play with it more

It worked fine for a couple of years and now it starts. I just started using DXLab but I think this happened before I switched over. I do know this, I had a problem with one of my menu screens and even with 3.030 and using Logger32 I get that screen again (MENU-SSB), it's grabled.

As soon as the battery gets here, it's going in $9 from TT, hope it's here Thurs or Fri

. Bob, if the battery does not change anything or I can't find a solution I'll send it back. But Paul never mentioned that but others have

very good findings! it would be great to understand which commands are exchanged with the orion when this event occurs. If you could share this information I can pick it up and run it through load testing and tracing. Thanks so much and best regards, onno

Subject: RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

I may have this issue narrowed down but here's what I can make it do.

If I have not logging program running (with cable connected) Both VFO's appear to work fine. I cannot make it go bad.

If I run dxBase and QSY by clicking on a dx spot, both VFO's appear to work

Same for Ham Radio Deluxe

But if I load DXLabs. It seems to be fine until I click on to a DX spot. I have made this go bad 4 times in a row NO TRANSMISSIONS WERE MADE

So I'm going to email Dave the author of DXLab and pick his brain

More to follow and thanks

John

. Catfish. Both vfo's are on the speaker and when I use my headphones, almost 10% of the time I have MAIN in left and SUB in right and it's easy to tell when VFO B heads south.

. Wes.. I ran mine for a few hours this morning w/o a cable connecting the PC and not a problem one, but as soon as I connected a cable for the PC control.. VFO B went out.

Right now I'm really confused on what it does or does not :L So I will play with it more

It worked fine for a couple of years and now it starts. I just started using DXLab but I think this happened before I switched over. I do know this, I had a problem with one of my menu screens and even with 3.030 and using Logger32 I get that screen again (MENU-SSB), it's grabled.

As soon as the battery gets here, it's going in $9 from TT, hope it's here Thurs or Fri

. Bob, if the battery does not change anything or I can't find a solution I'll send it back. But Paul never mentioned that but others have

OK Tom .. I have thought of that but I don't have any other "low battery" symptoms that I know of and the problem has been the same almost from the point of purchasing the radio brand new back when TenTec first released it Nevertheless, I'll keep the low battery idea in mind..

that turn it off and turn it back on fix is what I had here recently when my memory battery went out. easy to replace, remove top and bottom cases and loosen the front panel , it only goes in 1 way too. all kinds of weird problems , but a new battery fixed it. And fairly cheap too.. tom N6AJR

In a message dated 3/13/2012 6:54:23 P.M. Pacific Daylight Time, wesattaway@... <mailto:wesattaway%40bellsouth.net> <mailto:wesattaway%40bellsouth.net> writes:

This VFO-B problem is beginning to sound like something that has a number of
different causes because different people seem to have found different reasons for it to occur and different ways to stop it. Either that or we have inaccurate reporting, but some of the reports are fairly detailed.

In my case, I have had the VFO-B non-receive problem with or without the logging software (DX4Win and microKeyer II) running and with or without ever
transmitting. I have zero RFI in the shack, with a TV set, computers and other electronic gadgets sitting within two feet of the radio and showing

zero ill effects. I do not run an amp. I doubt that in my case RFI is the problem.

For me, the cure is always the same ...Just turn the radio off and then turn
it back on. Once I do this everything is normal (tending to rule out RFI),
including hearing signals on VFO-B. The radio never misses a beat and all frequency settings, filter settings, etc, stay the same between the on-off-on cycles. My VFO-B non-receive problem is infrequent but I have never had it reoccur during the same operating session after going through the off-on cycle. I don't actually know how often the VFO-B problem occurs because the only time I use VFO-B is if I need to use "split" for DX and even then I don't always listen on VFO-B. The transmit function works on VFO-B even if the RX function is not working.

For the record, I am using the latest firmware and there was no change in the VFO-B problem as I went through various upgrades over the years. It is exactly the same problem now as it was several years ago.

All this makes me think that in my case the synthesizer explanation makes the most sense although I don't know why the off-on cycling "fixes" it for an entire operating session that may last for several days if I leave the radio on that long.

Over ...

Subject: RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

GOT ANOTHER QUESTION

Has anyone ever had RFI problems effect their rigs?? Sounds funny but Paul
from TT answered an email about my VFO B issue and wanted to know if I
would
try it with a logging program connected. I disconnected the cable from the
PC to the rig and operated "old school" no logging program and it ran for
hours today with no illeffects. I did not do a lot of QSO's but I did do
tests on several bands using the amp and all ok

I then connected the cable and loaded up DXLab, my current log choice, and
at the onset both VFO's were ok. I got brave and decided to try a contact
on
17m with the amp, BAM, VFO B is back to being locked in a some freq but
the
display can be changed. I'm not too sure if it went south as I changed
bands
to 17m but it was after making the contact, which was simplex BTW. My cable

is a home made cable but it's been in use for over a few years, last year I added signal lines for my STEPPIR controller. I know it does it with DXLabs and Logger32. I have DXbase and HRD also and will try it with them

Also on my power switch, the new switch does not power the rig down, Paul says "Turn on problem: Probably a problem with the turn on circuit on the back panel board, sounds like a leaky transistor."

Thanks in advance

John

<mailto:%27orion565%40yahoogroups.com> '
Subject: RE: [orion565] VFO B loses signals Orion1- UPDATE SYMPTOM

An additional "FIND" with my VFO B issue.. What I found over the weekend is that VFO B does hear.. but on a reboot it hears on 14.035, the default frequency after a master reboot. No matter what band I tune to or tuning the
VFO knob it's listening to 14.035. It just seemed like it was hearing nothing but I kept hearing a CW signal when I was in the phone band and finally found it. NOW the other scenario.. If I do a reset and the VFO B does work it's all good until it goes bad ;) then what ever frequency is in VFO B is stuck there. Example if I was working RTTY split and VFO B decides to stop working properly, that's the signal I keep hearing in VFO B. Again no change when I change bands or manually enter a frequency. I've gone back and put 2.063x and 2.062a in and the same issue. I cannot determine if there is any thing I'm doing to make this happen but running DXLab, FLDIGI and FLDIGI bridge, N8LP VCP on a XP PC .

Again others suggested a weak battery can cause strange issues but one was ordered Friday from TT but will not ship until today so I'll wait for that and see. I'll be replacing a bad power switch (rig won't power off with switch) and checking all the jumper cable connections when I get the covers
off

If no fix is found..it's headed to TT HQ

Thanks

John

Subject: [orion565] VFO B loses signals Orion1

My B VFO all of a sudden stopped hearing signals. There's noise but no
signals. I can find a signal with VFO A but not with VFO B. This started
here recently. Most times I have to do a MASTER RESET and I can start to
hear signals but I lose them after a short period.

I read in a 2005 post of maybe some DSP issues?? Using ver 3.030

Will reload with a older version tomorrow and see what happens

Thanks
John

Hello John,

Unfortunately I am travelling and cannot install and test DXlabs myself but I have been peeking into their website. Looks like a very fine product. also found that there is a function to capture the information exchange between computer and rig. Its call commander messages http://www.dxlabsuite.com/commander/MessageCapture.jpg

Would it be possible for you to start the message capture function and than reproduce the issue you found when clickin on the the function causing the sub rx to stop working? Hopefully the serial command exchange will be captured and you can share it with me. That would make it much easier when I am home end of the week.

Thanks and regards, Onno

8050. RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-14 18:17:06 UTC
From: Dave AA6YQ
Topic: 7992 Message: 8050

There is no CAT command that any transceiver application can send to an Orion that will cause VFO B to behave in the way that John KO4XJ has described.

Neither HRD nor DXBase have the ability to extract a QSX frequency from DX spot notes and with one gesture setup both VFOs for split frequency operation. DXLab does have this ability; there are many Orion owners using DXLab, and none has reported the behavior John reports.

I can think of only two possibilities:

1. Commander is not configured to use Flow Control in its interactions with the Orion, resulting in the Orion's processor being overrun and operating incorrectly; the solution to this is to configure Commander to use Flow Control, as shown in step 4.c of the instructions in

<http://www.dxlabsuite.com/dxlabwiki/TranceiverControlTenTec>

2. The transceiver in question is broken.

73,

Dave, AA6YQ (author, DXLab)

Subject: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Hello John,

Unfortunately I am travelling and cannot install and test DXlabs myself but I have been peeking into their website. Looks like a very fine product. also found that there is a function to capture the information exchange between computer and rig. Its call commander messages
http://www.dxlabsuite.com/commander/MessageCapture.jpg

Would it be possible for you to start the message capture function and than reproduce the issue you found when clickin on the the function causing the sub rx to stop working? Hopefully the serial command exchange will be captured and you can share it with me. That would make it much easier when I am home end of the week.

Thanks and regards, Onno

[Non-text portions of this message have been removed]

8051. Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-14 18:59:59 UTC
From: pa1ap
Topic: 7992 Message: 8051

I leave it up to John to decide what to do. Not sure whats wrong with offering support and performing root caus analysis to collect facts.

Firmware V3.02x had some issues with serial communication and it sounds logical to me to double check if some sequence might have slipped through.

Regards, Onno

8052. RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-14 19:28:29 UTC
From: Robert Carroll
Topic: 7992 Message: 8052

I've commented on the issue a couple of times, but perhaps I should add a little more detail. I'm using DXLab, Win 7/64, Orion 565 and have not seen the symptom since the "synthesizer out of tolerance" repair was made quite a few years ago--well before I had moved to DXLab. I'm not quite sure what "out of tolerance" meant. TT told me the synthesizer did still work, more or less, but one of its parameters (I think it was locking range) was well out of spec and causing the intermittent "freezes" I experienced. Good luck clearing up the issue--it almost drove me insane.

Subject: RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

There is no CAT command that any transceiver application can send to an Orion that will cause VFO B to behave in the way that John KO4XJ has described.

Neither HRD nor DXBase have the ability to extract a QSX frequency from DX spot notes and with one gesture setup both VFOs for split frequency operation. DXLab does have this ability; there are many Orion owners using DXLab, and none has reported the behavior John reports.

I can think of only two possibilities:

1. Commander is not configured to use Flow Control in its interactions with the Orion, resulting in the Orion's processor being overrun and operating incorrectly; the solution to this is to configure Commander to use Flow Control, as shown in step 4.c of the instructions in

<http://www.dxlabsuite.com/dxlabwiki/TranceiverControlTenTec>

2. The transceiver in question is broken.

73,

Dave, AA6YQ (author, DXLab)

Hello John,

Unfortunately I am travelling and cannot install and test DXlabs myself but I have been peeking into their website. Looks like a very fine product. also found that there is a function to capture the information exchange between computer and rig. Its call commander messages
http://www.dxlabsuite.com/commander/MessageCapture.jpg

Would it be possible for you to start the message capture function and than reproduce the issue you found when clickin on the the function causing the sub rx to stop working? Hopefully the serial command exchange will be captured and you can share it with me. That would make it much easier when I am home end of the week.

Thanks and regards, Onno

8053. RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-15 04:31:44 UTC
From: John Hudson
Topic: 7992 Message: 8053

Let me go through a very detailed scenario of what I have done three times today with each time the same results at the same time. Plus I'm going to send you the error log list and see if you can see when it happens or anything out of the ordinary. Also, I have used two other logging/rig control softwares that did not have any problems (except 1 menu screen in L32 that is garbled)..Sorry for the long post folks

I started with a freshly rebooted PC and a MASTER RESET (Battery Failure) and another MASTER RESET (Main RX/TX reset)

1. PC rebooted

2. Orion MASTER RESET (battery failure)

3. RX-366 INSTALLED (NO)

4. Orion Boots up

5. 2nd MASTER RESET (Main RX/TX reset)

a. CLEAR MEMORIES (YES)

b. RESET OPTIONAL FILTER (YES)

c. RX-366 INSTALLED (NO)

6. Orion Boots up

a. VFO A=14.250

b. VFO B=14.035

7. LOAD DXLAB (with new error log)

After DXLab loads and 20m is dead tonight (0330 GMT)

8. VFO A=Manually enter 7.200 then tuned to a signal on 7.154

9. VFO B= Manually entered 7.000 tuned to 7.007.6 cw signal

a. BOTH VFO's WORKING OK AT THIS TIME

10. VFO A=Switched to 80m then tuned to 3.539.5 CW signal

11. VFO B=Manually enter 10.100 and tuned to 10.115.5 CW signal

a. BOTH VFO's WORKING OK AT THIS TIME

12. VFO A=Switched to 180m and tuned to 1.828.6 CW signal

13. VFO B=Manually entered 7.150 and tuned to 7.153

At this time both VFO's are working as they are suppose to. Both receive independent signals and each VFO's frequency can be changed ok

14. I double clicked on SPOT COLLECTOR 3.795.10 VFO A changes to 3.795.1 but now VFO B is locked to receiving the 7.153 signal and I cannot change it with the VFO B knob or manually entering a frequency or switching bands with VFO A and try to change VFO B with A>B

A I have said I have created this 3 times today and get the same results at the same time but other logging programs are working as far as I can tell.

Also a side note, I was concerned whether a new battery would fix any issues, it does not. I installed a brand new battery today with the same results

Again sorry for the detailed procedure but I wrote it step by step for clarity

Thanks

John

KO4XJ

From: orion565@yahoogroups.com [mailto:orion565@yahoogroups.com] On Behalf Of Dave AA6YQ

Hello John,

Unfortunately I am travelling and cannot install and test DXlabs myself but
I have been peeking into their website. Looks like a very fine product. also
found that there is a function to capture the information exchange between
computer and rig. Its call commander messages
http://www.dxlabsuite.com/commander/MessageCapture.jpg

Would it be possible for you to start the message capture function and than
reproduce the issue you found when clickin on the the function causing the
sub rx to stop working? Hopefully the serial command exchange will be
captured and you can share it with me. That would make it much easier when I
am home end of the week.

Thanks and regards, Onno

8054. RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-15 05:59:01 UTC
From: Dave AA6YQ
Topic: 7992 Message: 8054

John, the screenshots you sent me confirms that you have Commander properly configured for flow control, thereby ruling out one of the two possible explanations for the behavior you've been reporting.

The remaining explanation is "your Orion is broken".

Bob W2WG's report of a "synthesizer out of tolerance" problem in

<http://groups.yahoo.com/group/orion565/message/8052>

seems to explain what you're seeing.

The diagnostic log you sent me contained no errors or indications of malfunction.

73,

Dave, AA6YQ

From: orion565@yahoogroups.com [mailto:orion565@yahoogroups.com] On Behalf Of John Hudson
Sent: Thursday, March 15, 2012 12:32 AM
To: orion565@yahoogroups.com
Subject: RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Let me go through a very detailed scenario of what I have done three times today with each time the same results at the same time. Plus I'm going to send you the error log list and see if you can see when it happens or anything out of the ordinary. Also, I have used two other logging/rig control softwares that did not have any problems (except 1 menu screen in L32 that is garbled)..Sorry for the long post folks

I started with a freshly rebooted PC and a MASTER RESET (Battery Failure) and another MASTER RESET (Main RX/TX reset)

1. PC rebooted

2. Orion MASTER RESET (battery failure)

3. RX-366 INSTALLED (NO)

4. Orion Boots up

5. 2nd MASTER RESET (Main RX/TX reset)

a. CLEAR MEMORIES (YES)

b. RESET OPTIONAL FILTER (YES)

c. RX-366 INSTALLED (NO)

6. Orion Boots up

a. VFO A=14.250

b. VFO B=14.035

7. LOAD DXLAB (with new error log)

After DXLab loads and 20m is dead tonight (0330 GMT)

8. VFO A=Manually enter 7.200 then tuned to a signal on 7.154

9. VFO B= Manually entered 7.000 tuned to 7.007.6 cw signal

a. BOTH VFO's WORKING OK AT THIS TIME

10. VFO A=Switched to 80m then tuned to 3.539.5 CW signal

11. VFO B=Manually enter 10.100 and tuned to 10.115.5 CW signal

a. BOTH VFO's WORKING OK AT THIS TIME

12. VFO A=Switched to 180m and tuned to 1.828.6 CW signal

13. VFO B=Manually entered 7.150 and tuned to 7.153

At this time both VFO's are working as they are suppose to. Both receive independent signals and each VFO's frequency can be changed ok

14. I double clicked on SPOT COLLECTOR 3.795.10 VFO A changes to 3.795.1 but now VFO B is locked to receiving the 7.153 signal and I cannot change it with the VFO B knob or manually entering a frequency or switching bands with VFO A and try to change VFO B with A>B

A I have said I have created this 3 times today and get the same results at the same time but other logging programs are working as far as I can tell.

Also a side note, I was concerned whether a new battery would fix any issues, it does not. I installed a brand new battery today with the same results

Again sorry for the detailed procedure but I wrote it step by step for clarity

Thanks

John

KO4XJ

Subject: RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

There is no CAT command that any transceiver application can send to an Orion that will cause VFO B to behave in the way that John KO4XJ has described.

Neither HRD nor DXBase have the ability to extract a QSX frequency from DX spot notes and with one gesture setup both VFOs for split frequency operation. DXLab does have this ability; there are many Orion owners using DXLab, and none has reported the behavior John reports.

I can think of only two possibilities:

1. Commander is not configured to use Flow Control in its interactions with the Orion, resulting in the Orion's processor being overrun and operating incorrectly; the solution to this is to configure Commander to use Flow Control, as shown in step 4.c of the instructions in

<http://www.dxlabsuite.com/dxlabwiki/TranceiverControlTenTec>

2. The transceiver in question is broken.

Subject: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Hello John,

Unfortunately I am travelling and cannot install and test DXlabs myself but I have been peeking into their website. Looks like a very fine product. also found that there is a function to capture the information exchange between computer and rig. Its call commander messages
http://www.dxlabsuite.com/commander/MessageCapture.jpg

Would it be possible for you to start the message capture function and than reproduce the issue you found when clickin on the the function causing the sub rx to stop working? Hopefully the serial command exchange will be captured and you can share it with me. That would make it much easier when I am home end of the week.

Thanks and regards, Onno

8056. Band data output for ALS-1300 amp?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-16 12:25:30 UTC
From: George
Topic: 8056 Message: 8056

Anyone make a band data output converter that would control the band changes
for my Orion-2 to work with my Ameritron ALS-1300 amp?
I note that my Icom IC-7600 sends various voltages for the band data output
that is used to convert to band changes that interface to my ALS-1300.
Ten Tec apparently uses pins that go high for the various band selected on
the rear band data connector pins.
Thanks.

George W2YJ

Hi George.

I just finished building and stuffing the board for such a beast.

Contact me offline for a chat. It is not too difficult.

I'm good in QRZ.

73,

Andrew

Hello John,

I might have been able to reproduce it.

When the orion just works (both main and sub);

1- if you look at the VFO matrix (to left of lcd screen) you see two columns with three buttons each. One (on the left) is for VFO A and the other (on the right) is for VFO B... Which button of the VFO B column has led turned on? I would expect the bottom button LED to be turned on.. (indicating VFO B is assigned to sub rx)

When you have the problem could you check the following;

2- if you look at the VFO matrix (to left of lcd screen) you see two columns with three buttons each. One (on the left) is for VFO A and the other (on the right) is for VFO B... Which button of the VFO B column has led turned on?

Best regards, Onno

8059. Hello and LCD replacement FYI

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-16 21:19:31 UTC
From: Doug
Topic: 8059 Message: 8059

Hello, I've been lurking here for 6 weeks or so. Have had my Orion 1 for 5 weeks. I am very pleased with its performance, and Ten Tec's on going support of this radio. I chase weak signal CW and there is nothing that I have used that even comes close to this radio's capabilities.

I purchased my Orion from and older ham in Minnesota. Its a cherry, only issue was when I took it out of the box there was a thumbnail sized blotch on the screen. I had already read of this on the reflector so I wasn't surprised that it was damaged in shipment. Well I lived with this as long as I could and finally ordered the replacement LCD.

Following the V2 mods and PA1AP's excellent file on this I had the LCD swapped in about 20 minutes. Only trouble was on power up my screen was pure blue with no alphanumeric's. Now this is not my first experience taking apart electronics (Please see my bio on QRZ).

After pulling it apart I noticed that the wiring of the small circuit board attached to the ribbon cable of the LCD was different than pictured in PA1AP's LCD replacement PDF. If you look at the file and check the 3rd picture labeled Orientation of the cable you will see that the ribbon cable has a blue stripe on it. It is toward the back of the circuit board. The female connectors are on the other side and mate to the males on the logic board. The one I have has the stripe away from the back of board. If you attach this to the logic board the way you would think it should be attached pin 1 and 14 are swapped and no alphanumeric's. I had to mount mine with the LCD circuit board close to the logic board basically upside down if you like. It sits roughly and 1/8 inch above the logic board. I put electric tape on the board to isolate it from the logic board just in case.
Now I have a nice bright screen and no more blotches. I hope this information helps anyone replacing an LCD in the near future.

vy 73,
Doug N9NX

Hello Doug,

Thats interesting findings and good to know. It would be nice if TT would provide some documentation when they ship the blue replacement screen. Did they?

Second; you might have received a newer version of the lcd screen. Can you share if Blue on white still has the "flicker / jitter" problem or is it not there anymore? The first blue/white screens definitly had this sympthom and i am curious if this got resolved already?

Thanks and best regards,
Onno

Hello Onno,

The only documentation was a tiny slip of paper that said do not hook up the -20.5 VDC line. No other instructions of any kind. That did surprise me I thought and was lead to believe that there would be instructions of some sort with the replacement LCD.

To answer your second question I have mine set for blue letters on the white back round and have no flicker or jitter of any kind. Very stable and there seems to be little or no change in contrast. At least I can't see any and my Orion is usually on 12 hours a day or more. Hope that answers your questions.

Regards,
Doug

Thats interesting that the contrast supply is not connected anymore to the screen. I wonder if they have choosen to use the onboard contrast circuit instead... a new hint towards what happening on the previous blue /white screens I guess.

> > >
> > > I purchased my Orion from and older ham in Minnesota. Its a cherry, only issue was when I took it out of the box there was a thumbnail sized blotch on the screen. I had already read of this on the reflector so I wasn't surprised that it was damaged in

shipment. Well I lived with this as long as I could and finally ordered the replacement LCD.
> > >
> > > Following the V2 mods and PA1AP's excellent file on this I had the LCD swapped in about 20 minutes. Only trouble was on power up my screen was pure blue with no alphanumeric's. Now this is not my first experience taking apart electronics (Please see my bio on QRZ).
> > >
> > > After pulling it apart I noticed that the wiring of the small circuit board attached to the ribbon cable of the LCD was different than pictured in PA1AP's LCD replacement PDF. If you look at the file and check the 3rd picture labeled Orientation of the cable you will see that the ribbon cable has a blue stripe on it. It is toward the back of the circuit board. The female connectors are on the other side and mate to the males on the logic board. The one I have has the stripe away from the back of board. If you attach this to the logic board the way you would think it should be attached pin 1 and 14 are swapped and no alphanumeric's. I had to mount mine with the LCD circuit board close to the logic board basically upside down if you like. It sits roughly and 1/8 inch above the logic board. I put electric tape on the board to isolate it from the logic board just in case.

8063. RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-17 04:03:38 UTC
From: John Hudson
Topic: 7992 Message: 8063

Onno, you are amazing!! I wish I had been more observant to notice the SUB RX was being turned off

Yes when the VFO B goes bad, VFO B SUB RX LED is off. Push the Sub RX button and it's good until the next time I DOUBLE click a DX spot in DXLAB

Again this does not do it in Logger32 or I can't make it.

So do you know what causes this yet? Ten Tec firmware or DXLab software or they just don't like working together L

I really appreciate this a lot

73 and looking forward to hear back

John

KO4XJ

Subject: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Hello John,

I might have been able to reproduce it.

When the orion just works (both main and sub);

1- if you look at the VFO matrix (to left of lcd screen) you see two columns with three buttons each. One (on the left) is for VFO A and the other (on the right) is for VFO B... Which button of the VFO B column has led turned on? I would expect the bottom button LED to be turned on.. (indicating VFO B is assigned to sub rx)

When you have the problem could you check the following;

2- if you look at the VFO matrix (to left of lcd screen) you see two columns with three buttons each. One (on the left) is for VFO A and the other (on the right) is for VFO B... Which button of the VFO B column has led turned on?

Best regards, Onno

Onno, you are amazing!! I wish I had been more observant to notice the SUB RX was being turned off

Yes when the VFO B goes bad, VFO B SUB RX LED is off. Push the Sub RX button and it's good until the next time I DOUBLE click a DX spot in DXLAB

>>>In the General panel on the General tab of Commander's Configuration window, do you have the

"Accept Dual Receive directives" box checked?

ACCEPT DUAL RECEIVE DIRECTIVES is turned off Dave.. and it does the same thing whether it's checked or unchecked - SUB RX turns off on double click

Subject: RE: [orion565] Re: VFO B loses signals Orion1- UPDATE SYMPTOM

ACCEPT DUAL RECEIVE DIRECTIVES is turned off Dave.. and it does the same thing whether it's checked or unchecked - SUB RX turns off on double click

>>>With "Accept Dual Receive Directives" disabled, Commander sets VFO A to the spot's RX frequency, sets VFO B to the spots TX frequency, and then sends this command:

*KVANB

>>>which means "set the Main receiver to VFO A, leave the Sub receiver unassigned, and set the transmitter to VFO B"

>>>With "Accept Dual Receive Directives" disabled, Commander sets VFO A to the spot's RX frequency, sets VFO B to the spots TX frequency, and then sends this command:

*KVABB

>>>which means "set the Main receiver to VFO A, set the Sub receiver to VFO B, and set the transmitter to VFO B".

>>>So I can see exactly what Commander is sending to your Orion when you double-click a spot for a station operating split,

1. On the General tab of Commander's Configuration window,

a. Check the "Accept Dual Receive Directives" box

b. Check the "Log Debugging Info" box

2. Terminate Commander

3. Start Commander

4. Double-click a Spot Database Entry for a station operating split

5. On the General tab of Commander's Configuration window, uncheck the "Log Debugging Info" box

6. Attach the errorlog.txt file from your Commander folder to an email message, and send it my way

73,

Dave, AA6YQ

The orion behave correctly in this case and this is not a firmware bug or defective hardware on orion.

The external program sends an instruction to detach the sub rx and thats whats happening. The command sequence as send to orion will need to be changed.

Best regards, onno

8068. Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-18 08:15:15 UTC
From: pa1ap
Topic: 7992 Message: 8068

It might have been an exception with the synthesizer out of spec.

An easy mistake to make is to detach the sub rx from any vfo assignment. This is only visible through a single led being switched off within the vfo matrix section.

If not observed the user will experience a normal functional unit but without the sub rx doing anything. The frequency on the screen can be changed but nothing happens.

The remote control connection is a great value but also controls your rig for you. When you push a button on the orion you realize and know the consequence. But if a remote control program does this for you, behind the scene, you might get unexpected user experience.

Best regards, onno

Hi, John,

HI...just pulling your coax, my friend. I think most TT guys will say that it would be difficult to give up their Orions, regardless of vintage.

I have had an Orion since they came out, and the Orion II since they appeared. Have had hardly any trouble with either radio. The O II is just a step above the Orion, but only a little. I added the new receiver to my OII recently and WOW does that increase the usability of that radio. I'm really impressed.

Both rigs sound awesome on the air, and are simply marvelous in a two radio contesting setup like mine. I have amps on both rigs and band pass filters in front of each receiver. Many of my antennas are on the same tower, so I need the kind of brick wall front ends that our DSP rigs provide. They're an awesome pair.

Good luck John...just sell your 2000 setup and bite the bullet and get an Orion II. I see plenty of them on the used market for around $3000, with filters, and there is no difference between that radio and one that comes "fresh" out of the TT factory.

You'll be glad you did. Really in a different league from the 2000, trust me.

I am in Knoxville. Play with settings on bandwidth and make sure pass band is set at zero. Make sure DSP is off. Check it with internal and external speakers. I had to resolder speaker plug for the external speaker.

8076. RE: [orion565] Anyone in the Nashville area with ORION II?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-20 21:40:03 UTC
From: John Hudson
Topic: 8074 Message: 8076

John do a MASTER REST BATTERY FAIL ..power off then hold VFO –B LOCK button when you power on..hold it until you see the BATTERY FAIL msg. Let it boot up, turn the power off again and then another MASTER REST but this time hold the ANT 1 button under the MAIN RX/TX on the left side of the rig. Anwser the question CLEAR MEMORIES and CLEAR FILTERS with YES. NOTE this will remove all settings but it’ll take you back to as new from the factory. See if that clears it up.

Good luck

John

I am in Knoxville. Play with settings on bandwidth and make sure pass band is set at zero. Make sure DSP is off. Check it with internal and external speakers. I had to resolder speaker plug for the external speaker.

John,

All modes sound this way?

All bands sound this way?

Headphones and speaker sound the same?

What is your RF GAIN set at?

PREAMP on or off?

AN/NB/etc. on bottom row ... on or off?

(Just trying to help)

8086. Re: VFO B loses signals Orion1- UPDATE SYMPTOM

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-21 08:32:09 UTC
From: dhbernstein
Topic: 7992 Message: 8086

The resolution of this problem is that SpotCollector was not configured to enable the sub-receiver when selecting a DX Spot operating split. Enabling this option assigns the sub-receiver to the DX Station's TX frequency.

Good idea. If there is ten Tec can fix it. I have not down loaded the latest software. I may take it over to the factory and let them do it. I may get the new sub receiver also. Good reports on it.

8089. Orion II and AGC

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-22 13:34:06 UTC
From: ki4ps
Topic: 8089 Message: 8089

I've owned my Orion II for several weeks now. Having fun with the adjustable AGC.

Using the default settings seems to be very aggressive. I've changed the hang time from 0.0 to 00.47 s, for the slow, and it smooths out the SSB.

I still have my other settings for CW which I do a lot of.

I would be interested in what others are using for their AGC settings for both SSB, and CW.

Richard,

That was true, but 100 years ago they clear cut the country for firewood
and houses, not to mention fences. The last was for good neighbors

John I am very aware of the devastation to old growth forests. A lot of the wood went to furniture, such as the solid oak table where I am sitting that was a wedding present to my grandmother around the turn of the century. Of course, most paper today is produced from pine trees grown for that purpose.

8095. RE: [orion565] Does anyone have the alignment procedure for Orion II?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-24 14:08:53 UTC
From: Andrew B. Steen
Topic: 8095 Message: 8095

Hello John.

I too, have an issue with the master oscillator, as it is out about 57 Hz on 10mhz. On the low end of 80, I have to put in about 20Hz higher to be on frequency.

I seem to remember a pretty good tutorial on the reflector some years back, but I haven't found it yet.

Maybe someone out there can enlighten us.

Andrew

To: orion565@yahoogroups.com
Subject: [orion565] Does anyone have the alignment procedure for Orion II?

My O2 seems to be off frequency so I need the alignment procedure. Maybe someone has a copy of the service manual?

I'll bet there are a few pots, but witch ones?
To do the alignment procedure proper you need an accurate reference signal and the exact steps in sequence.
I wonder if a service manual exists.

Richard,

I found this for you on the web. I used someone's writeup similar to this.

http://blog.aa6e.net/2005/08/orion-frequency-calibration.html

Here is another

http://www.n5na.net/download/Orion_Freq_Calibration.pdf

Hope this helps,

Jay - KT5E

TRY TURNING THE PRE-AMP OFF, THEN TURN THE RF GAIN DOWN TO AROUND45 TO 60. THE ORION II HAS A VERY HOT RECEIVER AND YOU CAN EASILY DISTORT THE AUDIO - GOOD LUCK!!

Good idea. If there is ten Tec can fix it. I have not down loaded the latest software. I may take it over to the factory and let them do it. I may get the new sub receiver also. Good reports on it.

Well I did the alignment with my signal generator checked the frequency against a very accurate frequency counter. I was able to get the Orion with in 1Hz usually about 0.5Hz after the radio is on for 2 hours. My room temps was 75.F.

When I first got my Orion it was way off frequency almost 60Hz. after the alignment when I tune to lets say 7.200.00mhz the most it drifts is up to 7.200.01 or less depending on room temp. Not too bad at all! I then checked it against 15.000.00 WWV and it was just about prefect, So if you have good ears or are able to use a frequency counter you do this just using WWV but if you want to be able to get it to.05hz you need very accurate signal and frequency counter.

Now that I have had the Orion for a week I must say I am very impressed with it. When I first started to use the radio I set it just like I would set my Japanese radios, and yes you bet it sounded terrible and that's because I did not understand the concept of how the Orion is different than other radios.

The Orion II is not like any other transceiver on the market the design philosophy is very different than the import radios. The Orion II is a true "Operators" transceiver and can be more hands on but when you start to understand the options you have you find you can hear signals that you never herd before. I believe Ten Tec took some of the technology from their military communications division and passed some of it to the Orion II, it is simple, powerful, easy to repair and upgrade but most important is its ability to hear signals better than any other radio.

What I originally thought was a noisy radio turned out to be the quietest radio I have ever used. I found the key to the Orion is working with the AGC and Gain, once you get this part you find out just how amazing the Orion is. Like with most radios I might generally crank the gain all the way up and work with all the other controls to mitigate the noise to hear weak signals. With the Orion you can set the gain much lower and work with attenuation and get the noise level incredibly low. And just when you thought "do I have enough gain" and the receive goes almost silent BAM!!! Someone hits you with a +30 signal and blows you out of the chair. Bottom Line is Don't mistake quietness with low gain.

Well I have more to learn but I look forward to seeing how far I can take the Orion.

Thanks for everyone's help getting me started, that's the other thing I found was that Ten Tec users are some of the nicest people.

John,
You must be an experienced operator, everything you wrote is very true but most peeps don't come to this realization within 2 weeks like you did. I know it took me longer than that. Yes, more AGC threshold (2-3), appropriate decay, and turn back RF gain so that band is quiet with no signals and then kick in the NR at about '1' and you have a receiver quiet as a two meter squelched.

73,

Bill

8105. Re: Orion II and AGC

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-26 17:06:51 UTC
From: billw5ao
Topic: 8089 Message: 8105

Default settings produce a noisy receiver I have found. The greatest impact on this seems to be proper threshold and ALWAYS use the RF gain, don't just leave it at 100 on bands below 21MHZ. 80M I typically run it in the 60s.

hang relates to slow med and fast AGC. I have slow =.51, med =.25, fast =0.0. Variations from this to your taste.

Threshold between 2 and 3. Threshold relates to band noise generally and signal strength only if a very weak signal. Without an antenna connected, threshold at 2 makes the minimum s meter reading between s1 and s2, threshold at 3 makes minimum s meter reading between s2 and s3. So for weak signal work on quiet bands you may need less threshold, I use prog for that and it is used rarely.

Decay slow =15, med = 30, fast =80 to taste.

For a quiet receiver, more AGC threshold generally and turn back RF gain about to the level of vacant band noise and then kick in the NR at about '1' and you have a receiver quiet as a two meter squelched.

Very practical explanation and thanks for sharing Bill!

if I may add some theoretical information:

The receiver becomes (more) quiet when the agc activation point is moved above the undesired signal. By default the agc activation point is often below the band noise and this results in normalized band noise through agc routine. All signals above agc activation point have the same audio presence. Signals below agc activation point have less audio presence.

Unless you consider band noise as desired signal the recommendation is to move agc activation point above band noise and treat band noise as undesired.

Both threshold and rf gain move the agc activation point but its control use is opposite.. To move the agc activation point up one can turn -up- threshold or turn -down- rf gain. Both threshold and rf gain move the same agc activation point.

An example you can try; If you move the agc activation point using threshold to lets say s5 on the smeter (threshold value 16uV) you will notice that turning rf gain only starts changing something when turned below 78... This because rf gain range 100-80 is below the threshold value of 16uV and as such makes no difference. This confirms that the highest agc activation point is used from either threshold or rf gain.

I like the way Bill sets threshold to a higher value using one of the agc modes. Rotate through agc mode will up/down agc activation according settings. Keep in mind that each band might have different levels of undesired signals depending on time, environment, antennas etc.

Last but not least; there are different opinions on how high the agc activation level should be set. Some adjust the value just a little above band noise and some move it even above desired signals. The latter means that audio of desired signals below agc activation point will have less audio presence and as such you have to turn up the af volume. I have no opinion on this except that you should try all opinions to see which one works best for you.

Hope this provided some value. Enjoy the rig. Best regards, onno

It's fine to experiment with different AGC settings but realize that if you have your RF Gain set below 90, setting Threshold between 2 and 3 accomplishes nothing.

Thanks Bill and Ono for the explanation and info.
Ive had my Orion II for over a year now and have just tried your personal settings. VERY NICE! A definite improvement to what I had before.
A great radio produced by TenTec for sure, I cant imagine ever parting with it.
cheers Vk3IDX - Richard

From: pa1ap
Topic: 8089 Message: 8109

Agreed.

The highest agc activation settings leads. If rf gain is set to higher agc activation level then theshold value this means that rf gain value leads.

If rf gain is set to 100 and threshold is set to reflect a s meter indication of s3, this means that agc activation point is set to s3... now if you turn down rf gain to lets say 70 then the threshold value becomes obsolete and rf gain takes over agc activation point.

Hope this helps, best regards, onno

Yes the Orion is very quiet. Even when I turn off all dsp, Preamp, NR and set the gain at 100 the radio is quieter than any of my other radios with the same settings.
I do feel that the Orion II could use a cooling fan for the case to lower case temperature? Not only will this help with frequency stability it should make the Orion last a lot longer?

I took the plunge yesterday, and pulled off the bottom cover.

By switching between USB, and LSB, I was able to fine tune the TCXO. By checking the calibration with a friend's spectrum analyzer, My offset is now 1 Hz on 80, 5Hz on 40, and a little more on 20M.

Before the fix, it was 20Hz on 80, 60Hz on 10.000Mhz, and 93 HZ on 15.000 Mhz.

I did not feel any excessive heat on the board. My case over the TCXO and board remains cool to the touch, even after running for over 6 hours.

8112. Simple Non Destructive Case Fan Mod for the Orion Series.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-03-27 21:02:57 UTC
From: John_Tn
Topic: 8112 Message: 8112

Simple non destructive Case fan mod for the Orion.
I feel that the Orion II gets a bit hot inside the case and all though the Orion will function ok at these higher temps I believe the addition of a case fan has 2 big advantages
1. Lower case temp helps with frequency stability.
2. Greatly extends the life of the display and other components due to thermal breakdown.

Since I use an external speaker I decided to remove the internal speaker leaving a nice 4" opening where the speaker was to act as a vent hole and place a 12vdc 120mm low speed fan. The fan is setup to exhaust air out of the case.

I then place ¼" weather stripping around the bottom of the fan to make a nice seal over the speaker hole. The weather stripping also helps avoid any vibration from the fan transferring to the case.
Then I just connect an RCA plug on the wire and plug it in to the 12v accessory connector on the back of the Orion and just sit it over the speaker hole.

If you wanted to make it more permanent you can mount the fan to the cover with the speaker cutouts and it will fit where the speaker was.

However By just placing the fan on top of the radio you don't have to anything but remove the internal speaker.

This simple mod has made my Orion II More frequency stable and has lowered the case temp dramatically. I believe this with extend the life of by a lot!

I placed 2 pictures of what the fan mod looked like in the photos/Misc "Orion Simple Fan Mod"

Sweet and simple. Very nice solution indeed!

You can also use WWV as a reference. That's what I did, my O2 is now less than 1hz off.

I took the plunge yesterday, and pulled off the bottom cover.

By switching between USB, and LSB, I was able to fine tune the TCXO. By checking the calibration with a friend's spectrum analyzer, My offset is now 1 Hz on 80, 5Hz on 40, and a little more on 20M.

Before the fix, it was 20Hz on 80, 60Hz on 10.000Mhz, and 93 HZ on 15.000 Mhz.

I did not feel any excessive heat on the board. My case over the TCXO and board remains cool to the touch, even after running for over 6 hours.

Yes the Orion is very quiet. Even when I turn off all dsp, Preamp, NR and set the gain at 100 the radio is quieter than any of my other radios with the same settings.
I do feel that the Orion II could use a cooling fan for the case to lower case temperature? Not only will this help with frequency stability it should make the Orion last a lot longer?

> > What I originally thought was a noisy radio turned out to be the quietest radio I have ever used. I found the key to the Orion is working with the AGC and Gain, once you get this part you find out just how amazing the Orion is. Like with most radios I might generally crank the gain all the way up and work with all the other controls to mitigate the noise to hear weak signals. With the Orion you can set the gain much lower and work with attenuation and get the noise level incredibly low. And just when you thought "do I have enough gain" and the receive goes almost silent. BAM!!! Someone hits you with a +30 signal and blows you out of the chair. Bottom Line is Don't mistake quietness with low gain.

Ah.. I meant to say that. I did the alignment using WWV on 15.000 Mhz by flipping from LSB to USB. My friend then confirmed that my ear is still pretty good.

The fan mod really works! Since I placed the fan on my case the TXCO stays stable to .005Hz.

And the case temp has dropped over 25.F WOW! The case is now cool to the touch especially the LCD display. This Thing Is Going To Last And Last!

I highly recommend this simple mod for you Orion. Better stability longer life!

There is one small suggestion I like to add and thats installing an 8-20 ohm resistor to replace the removed internal speaker. This just in case the external speaker is disconnected while the orion is running. I dont know if the speaker amplifier is protected for running without termination.

Second, more intrusive : why not use the internal speaker frame to install the fan internally?

best regards, onno

Sure would not hurt to put a resistor in just in case. I had mentioned before that you could mount the fan from the inside and will fit in place of the speaker if you choose to do so.
I don't put anthing on top of the Orion so placing the fan on there was ok for me.

8120. Orion 565 Upgrade to v3

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-01 08:55:10 UTC
From: IK4PKN
Topic: 8120 Message: 8120

Hello everybody, I have done the upgrade from version 2.062a v2 to v3 3,030 new release, unfortunately after a few minutes the radio freezes, only the VFO and the ptt working ... Return to the previous version and everything works fine.
any suggestions?
regards
Paolo ik4pkn

Hello Paolo,

Sorry to hear the upgrade does not work for you. To assist you we would need some more information.

1) did you follow the upgrade procedure as provided by ten tec? In other words, there is more needed than just start upgrade program.

2) do you have any remote control program connected to the orion? If so which programs?

3) can you advice what you mean by freeze....are all buttons and knobs disabled? or just the sub receiver? If you press the menu button do you still see the sub menus? Etc... more information please.

Best regards, onno

8122. SSB receive bandwidth

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-01 13:46:00 UTC
From: Alan
Topic: 8122 Message: 8122

Hi Folks,

I'm a new owner of a used Orion II and have a question. When I adjust the receive bandwidth above 2.4 Khz I hear a dramatic difference in the tone and quality of the audio. It sounds like the passband has moved either up or down. I've installed several different versions of firmware, but this still occurs. All settings are at factory default. Is something out of adjustment or am I missing something (it wouldn't be the first time, Hi!).

Tnx,

Al

What you're probably hearing is the 6khz roofing filter kicking in above 2400hz selectivity, and it might have a different center point so the passband might actually be shifting on you. I can hear it on my Orion but it's not that much of a shift - probably less than 50hz.

Tnx for the response Barry. That's exactly what's happening. Is there a way to adjust the center point on the 6 Khz filter? I did do a master rest battery failure, ram clear, and master reset. That seemed to help a bit, but there is still a difference. Just wanted to make sure what I was hearing was normal for the rig.

Does anyone know if you can soft restart the orion without having to turn off the power? Maybe some kind of button combination?

Hello Onno,

I followed the instructions perfectly...

I have no other software connected...

when it freezes I can only move the main VFO and the ptt from
microphone...all the rest is freezing

bye

Hello Paolo,

Sorry to hear the upgrade does not work for you. To assist you we would need
some more information.

1) did you follow the upgrade procedure as provided by ten tec? In other
words, there is more needed than just start upgrade program.

2) do you have any remote control program connected to the orion? If so
which programs?

3) can you advice what you mean by freeze....are all buttons and knobs
disabled? or just the sub receiver? If you press the menu button do you
still see the sub menus? Etc... more information please.

Best regards, onno

Just a thought. Power off the Orion, then disconnect the serial cable and power up the Orion again. Cleared up or still hung?

Just trying to make sure there is not some state on the serial control lines that are hanging the Orion from working. Never heard anyone else having that issue but give it a try anyway.

I follow all the points, but the orion stops in step 6 showing the logo and the version of thefirmware, does not proceed to step 7

Installing the V3 Firmware:

The process to install the V3 firmware follows the same standard update process as with previous

versions. Follow the link "How to Update" as found on the Ten-Tec website at the downloads page for

the Orion(s) respectively.

The memory map for V3 firmware has changed substantially from what it was for V1 and V2 firmware.

Therefore it is highly recommended that you perform a RAM Clear and Master Reset after you have

programmed in V3 firmware into Orion(s) that were previously running V1 or V2 firmware.

The following outlines the proper procedures for RAM Clear/Master Reset:

RAM Clear.

During this process, you will see a "BATTERY FAILURE" message at the top of the radio's display.

Ignore this message.

If you leave this station while performing this operation, then it will time out and continue on. It is

recommended that you perform this procedure when you can dedicate time to follow the steps to

completion. If you do have to leave while doing this, then simply start back over at Step 1.

1. Ensure that the Orion is powered OFF

2. Press and HOLD the VFO B LCK button that is located underneath the VFOB>M button. See the

picture at the end of this document for a graphic showing the location of the VFO B LCK button.

3. Power On the Orion, continuing to hold down the VFO B LCK button.

4. When the "Master Reset Complete" Appears at the bottom of the display, release the VFO B LCK

button.

5. In a few seconds, you will be prompted with a message "RX366 Installed?"

6. Select the appropriate response.

6.1. If you have an RX366 installed, then press the AN button to answer "YES".

6.2. If you do NOT have an RX366 installed, then press the RECALL button to answer "NO".

If you selected "YES", and have an RX366 installed, you will notice that the startup screen will

state "RX366 Receiver installed" below the firmware versions.

7. Wait for the Orion to finish starting up for proper transceiver display showing 14.250 as the Main

frequency.

Once the Orion is back to normal operation mode perform the MASTER

I have the same problem but my was resolved when I connected the remote into the "correct" socket in the back of my rig. It's easy to make this mistake when you can't see exactly what your doing behind the rig (my excuse). When I called TenTec Support, they had not idea what was causing my problem, but I figured it out rather quickly when I began to retrace my steps.

It's writ checking....

Paolo,

I mean the 302R Remote Encoder Keypad that I plug into the rear of the rig.....

Oggetto: R: [orion565] Re: Orion 565 Upgrade to v3

I have the same problem but my was resolved when I connected the remote into the "correct" socket in the back of my rig. It's easy to make this mistake when you can't see exactly what your doing behind the rig (my excuse). When I called TenTec Support, they had not idea what was causing my problem, but I figured it out rather quickly when I began to retrace my steps.

It's writ checking....

8134. S-Meter issue - OII

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-02 16:31:09 UTC
From: w1nt
Topic: 8134 Message: 8134

Recently I have just noticed that it would appear that my S-Meter registers not much signal at all when rx'ing anything under about an S6. Signals above that seem fine as compared to the external panadapter S-meter. Basically, when the panadapter shows anything below a S6 the OII shows S0-S1 even with normal band noise yet all signals sound audibly correct relative to loudness.

I rarely pay attention to the S-Meter since RF gain is usually backed off but I am wondering if this is an issue with the firmware or if it is a hardware issue.

Has anyone else experienced this?

Thanks,

Brad

Interesting observation and curious to other 566 responses. I cannot help since i have 565... however it would be nice if you could share the following information
1 firmware version
2 if the sub receiver s meter is more active
3 if you have rf or af agc mode selected(depends on firmware version)
4 if you have threshold or rf gain at any other value than default setting
5 if you have ability to read the s meter value through serial connection through useof a remote program such as dxlab etc... this to understand if the digital s meter value is different than what you see on the big analogue meter...

Cheers, onno

I can only confirm for 565 unfortunately. Different audio circuit and hence no good comparison. Is this audio leak during rx or tx or both? And what firmware is used? regards, onno

Paulo what did you connect to the orion besides power? any other connection made? could you confirm which cables go into orion? as william states maybe there is a connection made into wrong port... please check and confirm which cables are used....

If nothing is connected besides power cable and antenna... i would suspect the cpu battery to be death....this will prevent the cpu from running.

From: IK4PKN
Topic: 8120 Message: 8139

Hello Omno and everybody, I bought this orion 565 used.. in this radio there was a modification ... it was a cooling fan mounted directly above u100a ADSP chip (analog devices). If I keep the fan running the radio with the new firmware v3 3,030 works without interruption, but if I turn off the fan after a few minutes I have the hang of operation. probably some component will warmthem around ... but it is strange that this does not happen with the old firmware! sorry for my bad English ... what could it be?

Paulo what did you connect to the orion besides power? any other connection made? could you confirm which cables go into orion? as william states maybe there is a connection made into wrong port... please check and confirm which cables are used....

If nothing is connected besides power cable and antenna... i would suspect the cpu battery to be death....this will prevent the cpu from running.

8140. orion 565: external ptt output

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-03 20:29:26 UTC
From: pa1ap
Topic: 8140 Message: 8140

Hi,

Hope someone can advice. I want to switch an external device to ground when transmit is activated. Seems there are several outputs available for this but it is unclear to me which option will work.

The external device is used for external sdr receiver which i want to take out of the connection during transmission. The sdr has buildin rf detection but also ptt input. Latter needs connection to ground to switch the receive to transmit relais.

Advice much appreciated.

Regards, Onno

If you always use the same ANT1 or ANT2, then you can use the corresponding
AMP KEY line.

I use the Amp Key line to switch out all of my RX antennas on transmit and to also switch out my SDR. This is all done in parallel with no issue.

I'm thinking of buying a used 565. I've seen a lot of problems with V3 firmware and not seen any upgrades for a couple of months. What's going on? Anyone want to calm my jitters :-)?

If you read the comments, I think you will find that the tech support is helpful and more responsive than most. What specific concerns do you have? Any bugs found should have been reported. Are you aware of others.

I have an original Orion, no changes nothing done to it purchased by me in 2003. I use a beta program to operate it. I don't use it very much but it is a great rig.

My question is should I send this back to Ten Tec for upgrade if so what benefit would I notice and any idea on cost?

V3 is a GREAT upgrade. But the great thing about firmware upgrades for the Orion is you can always go back to the one you have or others.

The Orion hardware is complex radio, electronically. It's what we pay for. I am pretty sure that also makes it a challenge to write new firmware to fix issues and provide enhancements because some parts of the circuits interact. The great thing is after the guys sift out what issues people comment on are real and which ones are cockpit error, the revisional changes to the versions come out.

Software and firmware are never perfect for any product. TEN-TEC does an excellent job for us. I tend to wonder if ICOM gave up on providing this kind of service since two of their latest rigs, if I understand correctly (I haven't confirmed), do not allow their customers to do any firmware updates.

Regards,

Gene / K7TXO

You buy, you like - a used v3 565 is the biggest bargain ever for a high performance hf xcvr

John Henry is doing a fantastic job at the helm of Orion firmware development.

A flash with v3 firmware is all it needs, assuming you don't use the sweep function.

Barry thanks.

I do use the sweep from time to time. But what improvement in performance can I expect from the change?

I would compare it like when you upgrade from an Icom IC-756Pro to IC-7800 (I have had those radios, so I know what I am talking about). After I have started to use PA1AP Onno?s recommandation and his small programs I have the settings now which gives me one of the greatest receivers I have ever used..
I dont know what it costs try to mail Ten-Tec and ask for a special price for you ;-)

8154. Very interesting no ALC on my O2

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-07 17:07:01 UTC
From: George
Topic: 8154 Message: 8154

I use a solid state amp and amps of this sort love ALC control. I looked at the O2 manual and "what" no ALC? Am I missing something or did TT overlook this rather normal control line that all the other transceivers I've had and currently have provide.
What was TT thinking?
Can this be added?
Thanks.

George W2YJ

I would compare it like when you upgrade from an IcomIC-756Pro to IC-7800
(I have had those radios, so I know what I am talking about). After I have
started to use PA1AP Onno´s recommandation and his small programs I have
the settings now which gives me one of the greatest receivers I have ever
used..
I dont know what it costs try to mail Ten-Tec and ask for a special price
for you ;-)

Hi John,
I own both a Orion and Orion II. Did the up grade on both.
No problem here. You will like the new SAF feature. It works
great. I use both the Orion and Orion II remote. Can’t tell
one from the other in remote operation. Best of luck.

Hi, Tim,

Well the difference is rather striking in v.3xxx because of the SAF PBT filtering feature as well as other enhancements. So, yes, it makes a difference. Barry sent you a link that enumerates the many changes that have been made to the firmware, so I suggest you do it.

The upgrade is free, no charge for any firmware updates from TT, and the v2 mod is useful if you use your band scope. Download the instructions for the v2 mod, I suggest printing out the pictures so you can follow along, and carefully do the mod...it's not difficult, just takes a bit of time.

Once that's done, you'll be able to enjoy all the features of the radio as well as v.3.xxx which is really good.

Good luck.

Just to make sure: with orion running hold and press the menu button for about 20 seconds. This should show you a screen with firmware message and if hw mod has been done it will display this too... can you share what you found?

Depending outcome there are several steps to be done:
1- decide if you want to use the bandscope in post v1 firmware. If so, excellent documentation is available and of course you can ship unit to ten tec. If you do latter they will also upgrade to v3 if you ask them :-)

2- if you want to upgrade without the hw mod I would recommend you ensure the serial connection is working well. This has been a struggle for some people and it is better to have all confirmed prior to upgrade. There is a serial test program available which might help. Experience has shown that old serialport cards seem to cause more issues and using usb serial dongle works better for most.

3- follow the firmware upgrade procedure as included on the tt website.

Most important: firmware upgrade cannot damage your rig. Deviation from the recommended steps will just make the process take longer :-)

Best regardd, onno

As explained previously, the upgrade allows you to run the band scope
(sweep). Only you can judge whether it is really worth it, i.e., if you
want to run the band scope or if you don't want to run the band scope.

Go ahead and install the v3 firmware and use the radio. If you miss the
ability to run the band scope, then install the upgrade.

8169. Headphones and Binrx question

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-08 14:33:26 UTC
From: Jay Schwisow
Topic: 8169 Message: 8169

All,

When I set the binaural receive to main with headphones on I lose this setting anytime I unplug the headphones. Plugging the headphones back in puts main receive to the left side. Does anyone know of a setting that will keep this from happening ?

I am trying to set left to both and right to both but this setting is dropped (reverting to left and right respectively) once I engage binaural to main.

I also noticed the side tone is more pure with binaural on instead of off - in my opinion. Why is this?

Jay Schwisow

8170. AGC activation point visualized

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-08 15:29:23 UTC
From: pa1ap
Topic: 8170 Message: 8170

Greetings,

I have tried to visualize the AGC activation point through three slides. The slides can be found through the link below.

General reference:

Audio presence reflects how loud the audio will come through your speakers / headset.

AGC activation point reflects at which signal level AGC will activate and normalize the audio.

Normalized audio presents a constant audio level through the speaker / headset.

Desired signal is what you want to hear and undesired... well I guess thats obvious :-)

Slide 1;

The graph visualizes signal strength (s meter value S0 ... S9+60dB) against audio presence (0% to 100%). The association is the red line.

AGC activation level (grey) is below desired (green) and hence desired signal will be normalized to 100% audio presence. Undesired (pink) is below AGC activation level (grey) and as such will have less audio presence. I cannot determine how much less audio presence but for sure it is less than 100%.

The blue table on the right provides the association between S meter indication and threshold or RF gain value.

One could say that this would be an ideal adjustment.

Slide 2;

AGC activation level (grey) is below desired (green) as well below undesired (pink) and hence both signals will be normalized to 100% audio presence.

Not a good adjustment unless you really want to hear undesired as loud as desired.

Slide 3;

AGC activation level (grey) is above desired (green) as well above undesired (pink) and hence both signals will have less audio presence. The ratio is unknown to me and as discussed before you will need to increase AF volume to copy desired signal.

One could say that this would be an ideal adjustment.

http://www.box.com/s/4ed78bbd122bf511c9e9

Hope this helps, Best regards, Onno pa1ap

Jay, my 565 sidetone sounds identical whether BinRX is engaged or off.

As far as the rest, I don't have a clue what you're trying to do with
mixing the subreceiver audio into both L/R and engaging binaural at the
same time.

Bineural receive requires a stereo headset and if you disconnect the headset the set will turn back to mono again. This is normal behavior I believe.

Next, through the audio menu you can select which audio is mixed to the speaker. This can be sub or main or both. When connecting stereo headset without binearal you can choose which audio is offered to left and right.

Like Barry mentioned, I am not sure whats missing or what you are looking for.

On the sidetone ; are you refering to the transmit sidetone or on the cw signal as received through the bineural audio mix? in the latter case keep in mind that sub and main rx could be more or less aligned. Depending on the delta the received tone might sound a bit different.

Regards onno

Onno

Ok I figured this may be normal behavior. It is kind of a pain to always reengage the binrx for headphone use.

On the sidetone I am referring to the transmit sidetone. On my rig it is different with binrx on vs off.

I appreciate your input

Jay, binrx persists through headphone unplug/replug on my 565. I'm not seeing your problem here.

Same overhere. Using 3030 with 565 stock rx. Set bineural to main, plug in headset, unplug headset and plug it in again. Bineural is not lost.

Also checked on the sidetone but cannot detect a difference in tone quality. It sounds the same to me.

I can only guess it is related to the V2 firmware. Perhaps an upgrade can confirm this Jay?

Best regards, Onno

I am unable to reproduce the audio leakage on my 565, stock rx and 3030 firmware. We will need someone with 566 to check for you I am afraid... Best regards, Onno

Haven't been following this thread closely, but, for what it's worth: On my O2 (566; FW: 3.028) there's a faint bleed through of Rx audio to the speaker (external), when volume is turned all the way down or when it's muted.

Well, just to make it abundantly clear, I updated to 3.028 (17 Feb.
2012) this morning, and see the same thing - faint bleed through, not
enough to be a serious problem, but an annoyance nevertheless.

Yes, and it's the Wanted signal (mostly I notice it when running JT65)
that bleed through.

8193. Frustrated with failed update

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-11 01:44:04 UTC
From: k7fd
Topic: 8193 Message: 8193

OK, I'm puzzled. Using com1 according to XP device manager. Have supplied cable from rig to pc. Followed the instructions to a T.

On the Flash Update Utility program it says:

Detected Command line switch to ignore radio responses and errors.

Then it gives the path to the *.ruf file

10640 total lines in file
Using Serial interface: Using Serial interface

Orion ROM update file

Then I get a an ERROR ENCOUNTERED message box that says
communication with the radio has failed and the radio may not
function properly. Check for proper power and interface connections. Cycle the power on the radio and retry the programming operation.

OK, I did all that. Nothing but the same error. Anyone have any ideas other than a bad serial cable?

Thanks!

73 John K7FD

HI John,
Have the same problem here. The port that you can use is the one that the prolific driver is attached to, when you install the prolific driver. If it tells which com port it is using, write it down for future reference. Yu can then use that port whwn you are going through the settings part of the ten tec update program. It has worked for me twice no, so it may be able to help you as well.

Thanks for the responses! I successfully installed the latest version...

Initially I tried a Dell Latitude D630 with built in COM port. Even though COM 1 was listed in XP device manager, I could not get the upgrade to install.

Plan B: I installed a Keyspan USB to Serial Converter on my Windows 7 workstation. It come up as COM 7 in device manager. I changed the Ten Tec software to COM 7 and away it went...no problems!

Thus, I am a happy camper! I have only had the Orion II a week...but I LOVE THIS RADIO! Immediately I can tell the latest upgrade has smoothed the received audio out...the difference is night and day!

Good job Ten Tec!

Good news indeed!

Please keep in mind that although the upgrade program allows the user to ignore error check this is not recommended. For all upgrades the error check should be enabled to ensure all and the correct code has been stored within orion memory.

When error check is disabled you can upgrade the orion and it even might work. However if there are corrupted Bytes this might result in weird behavior later on as there is no way for the orion itselve to check for currupted code. Without error check its like building a skyscraper and at floor 3 someone mounts the wrong (shorter) corner pillar.... the building wil not brake right away but sometime later it might.

best regards, onno

Well, I tried to update my OII and the square box shows it face giving me the communication with the radio has failed.

I know my com 4 port works with the radio because I use N4PY software with no problems. My computer has a serial card with DB9. I did this so there is on need for the USB/serial adapter. I also have a Eagle and Omni VII which I update with no problems.

NO! The N4PY software is not running. The com port is free for the Orion II. This radio is about one month, and this will be my first update for it.

Is there a bug in the program?

My conclusion after years of sometimes upgrading but also watching the units that have been left brain dead (including other rigs such as the FT-2000) and which have had to be returned to the factory for revival is that upgrading firmware is not an action to be taken lightly. When the 565 came out I was quick to try every update and move around to look for the best one. But I have changed my thinking. If the firmware works well enough, I don't change it but wait till the rig goes back to the factory for another reason to update.

I also used a pc with a built in com port the first time and had no success. It doesn't seem logical, but when I used a USB to serial converter, it worked!

Hi Jerry -

There has been much discussion on this topic on several different brand/model radios so you are not unique. Based on what you describe, your issue is not the radio or the firmware. The issue is the computer, specifically the serial port and something called "interrupts".

Slow and occasional data flow that would be typical with a program like HRD or N4PY may work perfect on the exact same physical and "com" port your trying to use now. But firmware updates represents a fairly continuous stream of data for an extended period of time.

What throws you off the scent that it could possibly be the computer is that you may have had other radios or Router boxes or other equipment get firmware updates to them perfectly through this same computer/port/cabling. But a larger batch of data flowing continuously can be interrupted by an "IRQ" event in the computer. You just have to use a serial port/com configuration that is not going to have data flow stopped for a split moment by another event (or events!) inside the computer that you do not know is even occuring. And these events are not necessarily anything you do. Frustrating to say the least but you are going to have to either change to a COM port that is not "shared" or try another computer. Add-in serial cards are usually not a problem. It is the assignment of shared com ports to that board.

If your computer has a physical serial port on the motherboard, that is usually a better candidate for having by default, a com port assignment that is not shared. Otherwise you have to study this and select one in your Device Manager control panel. Get to that configuraton state and a proper firmware update of any conceptual size needed by any type of equipment your connected too will stream until the end of line and your update(s) without error.

This is totally out of the control of TEN-TEC, LINKSYS, ICOM, CISCO, whoever so there is no decent way to write up an article.

You can browse the Internet on the subject of IRQ's and shared interrupts if you want to dive into this.

Basically, a "clean computer is a happy computer" together with a studied selection of the best serial port. Otherwise these things can just drive you crazy.

Gene / K7TXO

>
Yes, it's worth the cost for me. Recommended for contesters and serious
dx'ers who make frequent use of the subreceiver - especially cw ops.

From: Jerry Rogers
Topic: 8193 Message: 8210

Well all is good with the upgrade to my Orion II. I've been using my desktop with a serial card for the Omni VII, and other rigs for sometime now. The Eagle and Omni VII have never given me a problem with FW upgrades on this computer.

Well I seen where someone had to use their USB/Serial adapter to make the FW upgrade work. Since I had one, I gave it a try and it worked for me. So in the future if one computers does not work, I'll use the other for upgrades.

I must say, I have never had an issue with upgrades before. My Orion II was using the V2.044A and that was fine. I waited on the V3 until some of the bugs were corrected.

Anyway, sorry to alarm you guys, and thanks for all the info, and help.

From: John T. Fleming
Topic: 8208 Message: 8212

Tom,

It depends how you use your Orion. If you are a contester, you will want it. If you like to listen to foreign broadcast, etc. do not buy it. It is very ham specific and on general coverage, it is like the entire side of the barn is open. Look at the Ten-Tec info and they talk ham band specific. I talked to both John Henry and Stan at the Orlando Hamcation. For my usage which is SWL, I will have wasted my money. The original is better for that purpose.

73,

John

PS My son and wife live on 56st Street.

8213. external ALC

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-11 20:23:15 UTC
From: George
Topic: 8213 Message: 8213

Just got an answer back from TT on external ALC. They don't do external ALC!
Why do all the other manufactures include external ALC? Maybe the big three
are wrong and TT is correct in this regards.
You better not be running 100 watts from the O2 and forget to reduce it to
25 or so watts to drive the Icom PW-1 amp!
It seemed like a no brainer to me. Call me disappointed.
I wonder if anyone knows how to add external ALC to the O-2 or do I have to
just, "forget it and move on to another rig"?

Hi John KI4JPL, and the group,

I have a question to ask.
I bought a used orion 565, if I install the firmware 3,030, I must to cool the dsp ic, otherwise the radio freezes. If I leave the old firmware installed 2.062a, I need not to cool the dsp. Can be that the new firmware due to many operations causing this overheating?

I had the 565 running for days in a row performing all sorts of punishment during beta testing and never found the unit hanging. To me it seems something else might be wrong. It could be that the code claims more bytes and hence you might be running into a defective memory segment. Or the pcb might have a pcb connection broken or bad solder. Its guessing for root cause. How long does it take for the orion to freeze when cold started? Does it take seconds, minutes, hours? If hours heating could be the issue. But seconds it indicates some sort of defect causing the firmware to crash. if I have the unit running the chips get hand warm at most. Do you know which components gets overheated? Regards, onno

Well I'm sure pleased with mine! It's great to have my OII with two terrific receivers.

As aways, your mileage may vary (YMMV) but for me, I find it a great upgrade to an already great radio.

BTW, it also works for general coverage as well, and I listen to AM broadcast on it all the time.

Ok, Now I'm confused. Does it receive general coverage or does it not receive general coverage. I thought I read that it did. I am also wondering how it compares to the original main receiver in the Orion II. I am getting the impression that it is better.

From: storygene
Topic: 8193 Message: 8224

Very good Jerry. By using the USB to Serial, that means a different physical port which either did not have a shared IRQ or it is shared but nothing in the share envoked an interrupt during the time of the firmware data transfer. This is more likely than anything to do with the adapter type or it's driver. In the end, the data transfer speed remains the same since the gating factor is the bits per second that the radio works with which is slower than USB is capable of providing.

In many commercial situations, I have run into many situations with the exact same results on USB to USB and USB to Serial too.

Re your serial interface card: If you want to study the original issue farther, you can look into the subject of Interrupts as related to PCI slots on the Internet. It gets a bit convoluted to keep it all straight in the mind. Sometimes the issue you had can be solved by simply moving the card to another slot. Depending on the motherboard you have, you may be able to tinker at the root of this by making changes in the BIOS window that comes up (usually flashes by quickly so you have to know how to freeze it to remain on screen) before Windows OS launches.

On the other hand; you found a solution and I can understand you probably would just like to leave this as-is. Re: If it's not broke, don't fix it and no more frustration to be sure! It is certainly more fun to just get back on the air.

It could be that the code claims more bytes and hence you might be running into a defective memory segment. Or the pcb might have a pcb connection broken or bad solder. Its guessing for root cause. How long does it take for the orion to freeze when cold started? Does it take seconds, minutes, hours? If hours heating could be the issue. But seconds it indicates some sort of defect causing the firmware to crash. if I have the unit running the chips get hand warm at most. Do you know which components gets overheated? Regards, onno

I think the open barn door is lack of band pass filters outside the ham bands.

Thanks Gene for your input. Well received, and all the others that gave input also.

I must say the upgrade from V2 to V3 with the SAF is great. Being a cw operator that's an item I missed. As I write these comments, I'm on 75 meters SSB and just used the SAF for a very weak signal. IT WORKS.

Again, thanks for all the input. Will log it in my GRAY MATTER.

> Very good Jerry. By using the USB to Serial, that means a different physical port which either did not have a shared IRQ or it is shared but nothing in the share envoked an interrupt during the time of the firmware data transfer. This is more likely than anything to do with the adapter type or it's driver. In the end, the data transfer speed remains the same since the gating factor is the bits per second that the radio works with which is slower than USB is capable of providing.
>
> In many commercial situations, I have run into many situations with the exact same results on USB to USB and USB to Serial too.
>
> Re your serial interface card: If you want to study the original issue farther, you can look into the subject of Interrupts as related to PCI slots on the Internet. It gets a bit convoluted to keep it all straight in the mind. Sometimes the issue you had can be solved by simply moving the card to another slot. Depending on the motherboard you have, you may be able to tinker at the root of this by making changes in the BIOS window that comes up (usually flashes by quickly so you have to know how to freeze it to remain on screen) before Windows OS launches.
>
> On the other hand; you found a solution and I can understand you probably would just like to leave this as-is. Re: If it's not broke, don't fix it and no more frustration to be sure! It is certainly more fun to just get back on the air.

Since there has been very little posted on the two major Ten-Tec lists
about this, I figured I'd respond to this one.

I have an RX366 installed in my Orion II and I'm using it with an
Elecraft P3. This isn't an LP-PAN, but your results with the LP-PAN
would be very similar. One other person on these lists posted
a request for people's experience as he was using his RX366 with
an LP-PAN and I corresponded with him enough to know that the
results are very similar using the RX366 with either the LP-PAN
or P3.

I'm using the P3 with a Z100000B 15db preamp between it and the
RX366. There are only two (perhaps three) negatives.

o There is about an S9 spur at -14.06Khz that is constantly there.

o The 9MHz IF output from the RX366 is a fair amount of ripple
in it's passband -- that is the response/sensitivity varies
+/- 3db or so every 1 or 2 khz. There is a MUCH bigger dip
from +1.5 to +5Khz. That dip is about -10db or -15db and it's minimum
is at about +3Khz. By +10Khz that dip is back up to nearly the
same as the rest of the pass band. The LP-PAN user didn't like
that dip (he called it a "hump") and returned his RX366.
But, I guess I didn't expect the IF passband to be flat and I'm
really happy with the combination.

o When you are transmitting, you see your transmitted signal
on the RX366 IF output -- but the signal appears wider than
it really is and the entire display will shift upwards with
transmit output. This bothered the "hump" user above as well

because he wanted a good representation of his transmitted signal. That's not a concern for me either, but it might be for some others.

The 15db preamp is quite adequate, but to come closer to the signal level that the K3 would have given the P3, I'd need 20 or 25db. This is adjustable in the P3 so I can compensate for the 5 or 10 db difference in the P3 and it works just fine.

By the way, the receiver noise is flat across the 9MHz IF output. You see the ripple and +3kHz dip when the noise/signals from the antenna exceed the receiver noise. This of course is much (most) of the time. You'll see it distinctly if you put a white noise source on your receiver or with static crashes etc.

All in all I'm very happy with mine. All the other benefits people describe for the RX366 are certainly true. I wouldn't give mine up.

Also, I use it for general coverage as well and I haven't had any problems with that either.

I wouldn't give up my RX366.

Harry W5PNY

Thanks for your detailed response to my query. In some way I would have to agree with the "hump" user, especially on the monitoring of your transmit signal. I would want to know if my transmit signal was clean and within the correct bandwidth characteristic. For the cost of the RX366 my expectations would be adequate display of my transmit signal. The other issues you listed could be tolerated. Maybe TenTec will read this posting and consider update improvements to the RX366 design.

8234. Single errant pixel on 566 display

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-13 08:51:53 UTC
From: k7fd
Topic: 8234 Message: 8234

Has anyone experienced a random pixel...one 'dot'...on their display? I have one that is sitting about a quarter inch above the sweep scale just left of center. Its color is the same as lettering in the display, no matter what color scheme I choose. Sometimes it 'goes away' when I turn the radio off and back on. But then returns later.

I am on very latest V3.029 but noticed it was there at times on V3.026.

Unless V2 firmware does not show this pixel and this pixel does not move around you might have a dormant pixel in your screen.

I sorta stumbled into the O2, trading a Ten Tec RX340 receiver in on it. I wasn't seriously in the transceiver market, although my IC775DSP was indeed getting long in the tooth, hi. What got the ball rolling was the generous trade-in allowance Ten Tec offered on the RX340. I was pleasantly surprised to learn a 2004 vintage RX340 would cut the price of a new O2 by more than half!

Even more amazing, a new firmware release comes out a week after I purchase the radio! My hat is off to all those who had to wait...

For several years I had been 'kicking tires' at hamfests looking for a new rig that lit my fire a bit. I've been a big Elecraft fan since they started out, but for some reason the K3 didn't float my boat. No doubt it is excellent, but for me it lacked the kind of 'sound' I like to listen to when tuning around the bands. Yaesu and Icom had pretty faces for sure...but a price to match. So in the back of my head I kept thinking Ten Tec, but none were on display...

Luckily I took Stan Brock up on his trade-in offer and took a flyer on a rig I hadn't seen or heard. Reading the overwhelmingly positive reviews on eHam sealed the deal...

I must say the O2 looks beautiful! It looks much better in person than the photos portray in the magazines and on the web. And the sound of the receiver was all I was hoping for and more! It's like a a direct connection to the ionosphere! That kind of clean sound is rare...

After several weeks on the air, I have nothing but good things to say about the O2. But guess I'm preaching to the choir...

If someone is contemplating making a jump to the Orion II, I can only say my experience with the radio and Ten Tec has been excellent!

8245. Orion II: strange crackling noise

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-20 04:34:35 UTC
From: k7fd
Topic: 8245 Message: 8245

Hello, almost TGIF!

OK, a new little strange thing happened with the Orion II tonight. I switched the rig on, landed on 40M cw and noticed a 'crackling' sound in my headphones during my sending. Like a dirty pot sound. Maybe a poor connection at the headphone jack? Nope. Then I thought it might have had something to with the QSK and the rig trying to compensate for the S4 static crashes in between characters sent. But then I went to turn the volume control down and it crackeled a bit too with each detent. Got a whole lotta cracklin' going on here.

Anyway, after playing with ATTN, RF Gain, etc. looking for a solution I finally gave up and decided to turn the rig OFF and then back ON. Well, that cured the crackling noises! Apparently something...I don't know what...was out of whack but powering the rig down and back up cured it. This doesn't run a Windows OS does it? Hi...

Wonder if anyone else has experienced this odd behavior? This and the errant display pixel (which hasn't been seen since) have been the only strange stuff. Should I get used to these weird little goings on and just keep drinking the cool aid? I do love my Orion II...

Topic: 8248 Message: 8248

Hi all,

I am working on my Orion-I (3.032), which has an strange fault. Most times, it does not power up properly. It shows the usual "SYSTEM LOADING" and then, always, shows "Master Reset Complete" and asks if it has the RX-366 installed.

I have upgraded it today to 3.032, just in case the fault was a firmware thing, but problem was similar (not identical) with 2.068. What happened then is that unit powered up with low contrast and then all knobs worked OK but nothing was heard from the speaker nor any signal was shown on S-meter. What is weird is that, from time to time, unit powers up OK and works!. This has happened both with 2.x and 3.x firmware.

I am a semi-professional rig fixer (I have done about 1000 or so in last 10 years) but this is my third Orion-I work and the other ones had a very different problem.

I have tried the LOCK-B trick to reset memory and such, but it does not help either.

One thing which is different that it was with 2.x is that RF GAIN does not affect S-meter deflection. On 2.x it moved, but just to about S-5, when RFGAIN was at minimum. Now it keeps on zero.

I think there is a problem with the control circuit... any hint?

Thanks and best regards,

JOSE

Your battery may need replacing.

8250. Problem with my Orion-I

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-21 21:28:21 UTC
From: Jose V. Gavila
Topic: 8248 Message: 8250

Hi all,

Some further info:

-The Orion-I I am fixing is part of my shack :-)

-All power supplies are OK

-I have replaced already the capacitors at the regulator board

Looking for some info on the WEB, I have located a pretty interesting
article. Could my problem be related with this?

http://tentecwiki.org/doku.php?id=565battery

I read with interest this comment: "Upon initial restart I had no
audio output until I did a ram and master reset at least twice
(possibly three times) before the radio would function normally."...
which is close to what happens in my unit!

BTW, I have removed battery and, yes, voltage is just about 1.3V...

Thanks and best regards,

JOSE

From: Jose V. Gavila
Topic: 8251 Message: 8251

Hi all,

Well, I found the problem!. It was the RAM battery which was gone and so the unit didn't reset properly most of the times.

I have done some surgery to the original battery and have piggy-backed a CR-2032 plus a series diode (as nominal voltage was 2.8V) with a holder, so it will be easy to replace next time and I won't need the special battery plus it will last lots longer.

The final trick was to perform a MASTER RESET. Now the rig works and keeps the operating parameters after power up.

Thanks and best regards from a happy camper :-)

I'm glad you found the problem Jose. I tried to point you in that
direction, but I guess my message didn't get through.

Hi Barry,

Oops!. From the Group WEB page I can see your message (I am replying here), but I had not received it :-(!. And I have checked my spam filter and it was not there...

Well, anyway thanks a lot for your hint. I am glad that I finally ended in same place by myself, hi!

I will post some pictures of my 565 'mega backup system' ;-) in my WEB; when it is done, I will post here a link.

Best regards,

JOSE

The Orion II I just bought from a friend was connected to LP-PAN and I got all the goodies when I bought it. I hope to get everything hooked up in the near future so I will let you know how it goes. It is killing me to just look at it sitting on the floor but a family visit has put things on hold for a few days. It is going to look good on the same desk as my Argonaut V.

Well, the question I read was has anyone connected an O II up with LP-PAN. The Orion I bought was connected with LP-PAN and I plan on re-connecting it soon. Did I misread the question or should I have not answered until I had all of the wired connected?

I installed the LP-Pan on a previous Orion II using the Clifton Labs preamp/interface for the IF output. It worked very well. I also have used the Flex Radios and the LP-Pan was very comparable to them. Of course, the software is very similar so it should work very close. I am thinking about installing the LP-Pan in my current Orion II, also. I've been tempted to try the Elecraft P3, too. I think that would be an interesting combination.

8260. Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-26 13:29:51 UTC
From: Jerry Rogers
Topic: 645 Message: 8260

A strange thing happen today while I was on 75 meters with the Orion II. I as monitoring two 75 meter frequencies with the main and sub receivers. The audio menu was set for both main and sub (both)

When I would switching the frequencies via the A/B button so I could transmit one one of the frequencies ("A" VFO) the "A" VFO would show correctly, but would be off frequency by about two KHz. Sometimes I could hear the station, but the audio was very low.

If I turned the main dial back and forth, then the frequency corrected itself, and all was well.

I turned off the radio for several minutes, then back on. Still the same problem.

I then turned off the radio for about five minutes, and now all seems to be okay.

Very strange.

Just got my lightly used Orion II as well as the Ten Tec 712 interface. I have RTTY up and running but no joy on PSK31. I am receiving signals just fine and the radio does mute the receiver on transmit but no output to the power meter in USB mode. Do I have the wrong mode selected or what? The same thing occurs with either Fldigi or WinWarbler. Any help will be appreciated.

Make sure you have the input to the transmitter selected properly in the menus. I believe you should be running USB mode for each of those.

Phil.

Are you looking to find the equipment?

I have the LP Pan, and the external soundcard (EMU-0202), with all documentation for setup and installation.

It would not work with my new computer running 7Pro, so I am going with a stand alone receiver.

You can contact me off line @ n2gff@...

Check the files section of this forum. I posted a doc file last year on how to set up the O2 for digital modes using HRD, GigiPan, and RMS Express.

Hi Phil,

first you can check with the monitor on if you hear digital signal coming out.
Then look to turn up the Aux Input gain checking if the power becomes higher.
Next turn up the audio amplitude/volume of the device generating your digital signal.

Thanks to all who replied. It turns out it was the Aux Input Level turned down way too far and the fact that I didn't know approximately where to set it. Working like a champ now. Nothing like a little adversity to make you learn a new rig in a hurry.

Thanks for the help. Aux Input Gain was the culprit. Big signals are now available on PSK31 as well as RTTY. Thanks a million..

I was never able to get the TenTec 712 interface to work with fldigi,
but it would work with HRD. I just use a SignaLink USB instead of the 712.

8271. Orion I + Microham Microkeyer

Yahoo group: orion565 (2009 — 2013)
Date: 2012-04-28 11:14:44 UTC
From: javier
Topic: 8271 Message: 8271

Hi

I have a orion 565 with the interface microKEYER microHAM in rtty fsk works perfectly but in psk the system starts but does not draw power transmission, something I miss in the configuration of transceiver or microKEYER.
I've tried both DX4WIN, N1MM and WriteLog and something I'm wrong
Someone who uses it can tell me the settings you have in the Orion I and microKEYER

any ideas
Thank in advance
73 de Javier EA5DKU

From: fverlezza
Topic: 8275 Message: 8275

Gentlemen:

Anybody experimented the following problems:

Turning on the rig result is:

No signals (only white noise)on 40; 20; and 15m.
Max power 2w on same bands
Things are ok on 160, 80 and 10m

Then after 3 or 4 rig reboots every thing return Ok.

I already tryed with different firmawre and also several master reset, problem is still there....

Any suggestion? could be PLL?

Thanks

Filippp

When in doubt, replace the battery. Something similar came up a week or
two ago on this reflector.

The capacitors on the A9 board can cause many different problems. I would suggest that while you open the rig to replace the battery that you ALSO replace the capacitors.

Since I bought my Orion II I've had 5 A9 boards go bad on me. When you replace those capacitors make sure you over-rate them. I believe when they first came out, the 470uF caps were only rated at 16 volts. That was the reason for them breaking down (I believe). Then TenTec increased the voltage rating to 35 volts. Installing high quality 470uF 50 volt caps wouldn't hurt a bit.

I keep an extra A9 board in my shack just in case, ya never know...

First I'll replace battery and if problem is not fixed i'll replace the capacitors or the board itself..... Unfortunatelly in Italy Tem Tec has very poor aftersales service.

Any idea about the right capacitors?

The ones suggested by N6IE are not more available....

Besides voltage I have noticed the replacement capacitors are also of high temp grade. If I recall around 105 celcius..

I found these capacitors RUBYCON:

50ZL470M12.5x20 at 105° C

They are advertised as ultra low residual resistence and High current ripple.
I asked to Ten Tec service some idea...I'm still waiting an answer

8286. New owner Losing VFO B audio at times

Yahoo group: orion565 (2009 — 2013)

From: Phil Sikes
Topic: 8286 Message: 8286

Hello all, I have only had my Orion II for about a week now and don't know if I am causing this to happen or what. Two times now I have had to do a master reset to get the audio back on VFO B. It doesn't matter what receiver is attached to it and it can even be both on VFO B, but still no audio. I have looked at the Audio menu and see nothing out of line there. And the same for RX menu. I am changing nothing after this latest master reset to see if some of my config changes may be causing this. When it does happen, no matter where I assign VFO B audio I get nothing out. Any help will be appreciated. I do have the new RX 366 installed.

Hi Phil -

Is it possible that you have inadvertently pushed the SUB AF knob, assuming VFO B is using it at the time, and Muted the audio? Then you would see the LCD bar for the AF level represented by a half-height-high bar versus full-height. The difference you see on the LCD is minimal so it is easy to not notice when in this state. Twice would seem unlikely but thought I would ask anyway.

I have checked that every time this has happened now. I am sure it is knobology or switchology somewhere but I cannot figure out what I am doing wrong. This is a ton of radio to learn but I am feeling pretty good about it except for this one oddity. I am using DXlab software for rig control but i do not think it is the problem.

Thanks for the suggestion - Phil

Ok, good re checking the state of Sub AF. My bet is you will find it is not the rig, but external forces. Given this particular issue, I would recommend you confirm you have correct flow control setting or if you can live without it for a week or two, don't use external software. Assuming your 566 Orion II is a new one, not a used rig with unknown history, old/low battery, etc, the rig is less suspect in my opinion. Never say never though.

Grounding issues and RF feedback can introduce all kinds of anomolies but if this is the only issue your experiencing, I'd look at the 3rd party software especially version/revision and hardware with a focus on flow control settings.

Otherwise physically disconnect COMM cable for a short time if you can live with that and see what your results are. You could talk to DXLabs and see if similar issue reported in past. You'll get it nailed down. It's a hobby and sometimes the things that give us difficulties are great sources of learning if you don't go nuts in the process, hi hi.

Phil.. mine started doing similar issues a few months ago and drove me crazy. Mine is an O1 and had worked fine for years and then I changed to DXLabs from Logger32 (and done some new firmware updates at the same time) and started to have VFO B issues with no audio and I bet I reset mine 50 times over a few weeks. Look at these options when you loose audio.

When working split make sure VFO B TX button LED is lite - VFO A RX button is lite AND VFO B SUB RX button is lite

BTW do you have VFO B audio after Master Reset? Do you lose the audio after clicking on a split DX spot?

My issue is when I click on a DX spot in DXLab that does not have a QRX freq it does not go into split (even if was previously in split) so VFO B is dead or in my case it listening to the freq/mode it was listening too no matter how much you turn the VFO knob.SUB RX was not selected and or being Unselected.

So now I know to look at the SUB RX when I have no audio

Hope it helps

John

Thanks for the input John, I think you steered me in the right direction. The problem did seem to occur when going split with no frequency for the split from DXlab Spot collector. I checked all settings in DXlab and may have had a mistake in the DTR/RTS settings that I corrected. Kind of a perfect storm of small errors leading to a major problem. Anyway, so far so good.

Also Phil check your settings in the COMMANDER config under the GENERAL tab. In the middle of that screen see if you have ACCEPT DUAL RECEIVE DIRECTIVES checked? Mine is checked. I think I had a problem with that also.

8293. Re: New owner Losing VFO B audio at times

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-05 01:43:30 UTC
From: Phil Sikes
Topic: 8286 Message: 8293

Had that one already John, thanks for the input though. So far, two days now and no repeat of the problem. Now if the frequency police and lids would only give me an opportunity to work the 706T I would be a very happy O II owner!

[Non-text portions of this message have been removed]

8295. Re: New owner Losing VFO B audio at times

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-05 07:22:38 UTC
From: pa1ap
Topic: 8286 Message: 8295

Hope the problem has been solved. I worked on similar challenge a while back and we found the remote control program to detach the vfo from the sub receiver. The result was that the sub receiver appeared to be dead. As mentioned by others please check the vfo assignment (vfo matrix buttons) when the sub receiver seems to be dead.

Dont ask me why ten tec allows the sub rx to be detached from vfo. It is allowed per design but I cannot figure out the motivation why this is a value :-)

Second area of concern;
Remote control has been tested extensively both on load and command sequences. Although it is possible to send commands without hardware handshaking it is not recommended to do so. Hardware handshaking must be enabled and is used by orion to pause the remote control program when orion is busy with other stuff... with hardware handshake enabled I have not been able to cause issues within orion firmware.

Best regards, onno pa1ap

8296. Re: New owner Losing VFO B audio at times

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-07 01:35:08 UTC
From: Phil Sikes
Topic: 8286 Message: 8296

I am assuming the problem has been fixed now. 4 days now and no more problems. Man do I love this radio!! What a phenomenal receiver. This must be what it feels like to be superman only on steroids. I am one very happy Orion II owner. LP-Pan is next as soon as I get the sound card mod'ed for it, hopefully in the next day or so.

>
> Hope the problem has been solved. I worked on similar challenge a while back and we found the remote control program to detach the vfo from the sub receiver. The result was that the sub receiver appeared to be dead. As mentioned by others please check the vfo assignment (vfo matrix buttons) when the sub receiver seems to be dead.
>
> Dont ask me why ten tec allows the sub rx to be detached from vfo. It is allowed per design but I cannot figure out the motivation why this is a value :-)
>
> Second area of concern;
> Remote control has been tested extensively both on load and command sequences. Although it is possible to send commands without hardware handshaking it is not recommended to do so. Hardware handshaking must be enabled and is used by orion to pause the remote control program when orion is busy with other stuff... with hardware handshake enabled I have not been able to cause issues within orion firmware.

8297. RX-366 with LP-Pan?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-07 20:55:54 UTC
From: ve7tk
Topic: 8297 Message: 8297

I was wondering if someone in the group has an LP-Pan attached to their RX-366 yet?

If anyone has one would they mind posting a screen shot at full 192 kHz bandwidth on a busy band (20 meters would be perfect).

I have read some issues concerning a birdie at the low end of 20 and a "bump" but I'm not sure if either of these will be a "deal breaker" for me.

Many thanks.

I do have the new Sub RX and am in the process of getting LP-Pan running today. The sound card I have is only a 96K so I will not get the full 192K band spread. I will let you know how things transpire as I get further along. So far just lashing things together for a quick look it is pretty good. Running NaP3 software with a Creative X-Fi USB sound card.

Up and running now and it looks pretty good so far. I am using the NaP3 software along with DXLab logging and rig control software. The sound card is a Creative X-Fi Surround 5.1 (relatively cheap and seems to work well). I will try and get some screen shots in the next few days. I am happy with it as of now.

Topic: 8297 Message: 8306

There is a screen shot of my LP-Pan installation in my N7UX Orion/LP-Pan folder if you would like to see it in action. Unfortunately there isn't much action this morning with the A index climbing like it is. You can see the bumps at about 14.237 and another at 14.258.5, they are not too hard to overlook as they show as a steady bump with no intelligent information (cw or voice) and do not move around. A much better Panoramic display for me.

8307. Re: Problems on my Orion 565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-09 19:23:51 UTC
From: fverlezza
Topic: 8275 Message: 8307

After battery changing and several RAM Reset + Master Reset (maybe 10, or more) I still had the problem.
Then I had the Idea to repeat firmware installation from V1 to V2 to V3 and other several resets.
Now thing are ok since a couple of days.

To solve the problem, in the previous days, I had reinstalled the firmware several times, without results, but this was done with battery already exhausted (this is not helping ..).

I also changed capacitor....

Every thing now is fine

Thanks to everbody

Filippo

8308. Happy I bought an Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-12 04:20:35 UTC
From: k7fd
Topic: 8308 Message: 8308

I had heard Kenwood would be rolling out a new 'flagship' rig; by now you've probably seen pictures of the TS-990S on the Internet and the back page of QST. If not, a quick GOOGLE search will get you there.

Going on appearances only, I'm WAY glad I went ahead and purchased the Orion II. I do not like the front panel layout on the new TS-990S. It looks too tall and the additional LCD display above the main tuning knob is strange looking, with the freq readout a bit elongated. To me, it all is bit odd shaped. Of course, performance-wise it might be the cat's meow...guess we'll have to wait and see on that.

A price of $6000 is being bantered about; again, the Orion II doesn't put that big of a dent in the wallet. Six grand compares with Icom and Yaesu, the 'other two' I'm sure Kenwood feels is the competition.

Beauty is in the eye of the beholder but for this op, I'll take the Orion II over any offerings fromt the big 3, including the new TS-990S.

Any one planning to trade their Orion II in on a new Kenwood? Maybe someone on the group will get their hands on the TS-990S at Dayton and give us a first person impression...

I guess it will be in the Fall (October) time frame before the TS-990 is available.

As for me, I just purchased an Orion II that was mint. It looks great next to the Omni VII, and Eagle, and works FB.

The Orion II is my pick. It may seem I'm a cool aid drinker, but that's not the case. I've owned a lot of big rigs, and it was just time to go American. The JA's always lacked something in the audio quality to me. As for the Omni VII, and Eagle they are great radio also. But I've always wanted to spin the dial on an Orion.

PS: I counted the buttons, knobs, etc. on the TS-990 and it looks to be about 150 total. You talk about being BUSY.

<<snip>>

Well, not exactly. For those who haven't witnessed the "roll out" of other new Kenwood transceivers at Dayton, here's what you see: The new rig will be totally enclosed in a thick plastic display case. Most of the LEDs will be lit as will the display. That's it. You won't be twisting any knobs and none of the booth attendants will be able to answer any questions, but will give you a glossy marketing brochure. You'll be given a tentative availability date that will be missed.

When the smoke clears many months later, early owners will be griping about having to send their new $5,000 75 pound monster to California (paying shipping both ways) to get the latest updates (critical fixes). In the end, it will be just another high-end transceiver with a band scope superior to that in the Orion 2, and nothing more.

I went ahead and counted 108 things that can be pushed on that front panel, excluding things that turn.

You could possibly miss that QSO after tweaking things. LOL

Hi,

I have created a public folder and posted the most recent programs and documents I created for Orion. At present time it contains the agc macro discussion, orion backup software, serial port tester.

https://www.box.com/pa1ap

The public folder removes the dependency from yahoo group for non yahoo members.

Best regards, Onno

I must be missing something between the RF gain, and the AGC threshold settings. On my Orion II my settings for the Slow AGC is a threshold of 14.73 uV. That gives me about an S7 reading for 75 meters which is low enough.

I guess my questions is with the different AGC threshold settings, the RF gain would have to be at least 70%. Anything less and you defeat the purpose of the threshold adjustments.

Again, the relationship seems to be the same. One or the other accomplish the same effect.

Hi Jerry,

Dont want to confuse the discussion as it is really simple.. allow me to reflect a couple of statements.

There is only one agc activation point. Either threshold or rf gain will move activation point up or down. They are controlling the same but are confusingly called different.

Increase threshold to move agc activation point up.

Decrease rf gain to move agc activation point up.

Which ever control moved agc activation point highest will own agc activation point.

In case threshold value represent s3 and rf gain represents s7... rf gain will own the agc activation point. Other way around same applies of course. Rf gain value represents s4 and threshold represents s6... threshold will own the agc activation point.

If you forget to reset threshold within the rx menu and you dont observe the s meter reading while turning up rf gain to 100... your radio will be less sensitive than expected... I stumbled into this a couple of times when rotating through the agc modes... agc slow had a different threshold than agc med and it got me by suprise when moving from 40m band to 10m band... just something to be aware about.

Hope I did not complicate the discussion ;-). best regards, onno

Onno: Thanks for the responses. YES! You explained it just the way I was thinking. I've also noticed what you have experienced.

Still playing with the AGC/RF settings to find what works best for me. I did set up my Slow AGC with a threshold of 14.73/S7. A quick select to Med for Fast gives me more sensitivity.

A great rig, but sometimes my Omni VII seems a little easier to use. What I mean is the Omni VII just give me the slow/med/fast and less confusion. HI HI

The default settings on the Orion II for AGC seems to harsh. So by adjusting it makes the radio sounds so much better.

Subject: [orion565] Problem with my Orion-I: FIXED!!!

Hi all,

Well, I found the problem!. It was the RAM battery which was gone and so the unit didn't reset properly most of the times.

I have done some surgery to the original battery and have piggy-backed a CR-2032 plus a series diode (as nominal voltage was 2.8V) with a holder, so it will be easy to replace next time and I won't need the special battery plus it will last lots longer.

The final trick was to perform a MASTER RESET. Now the rig works and keeps the operating parameters after power up.

Thanks and best regards from a happy camper :-)

JOSE

8320. Re: [orion565] Re: OT: Orion windows programs and AGC visualization docs

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-15 19:21:40 UTC
From: Jerry Rogers
Topic: 8313 Message: 8320

With all this said about the activation point, and adjusting the threshold in the menu for AGC or using the RF gain, I see no reason to do anything with the AGC threshold.

I did change the threshold on the Slow setting since that is where I'm at the most. However, I use the RF gain all the time and it is usually about 60%. That defeats the AGC threshold.

The only thing I see in adjusting the AGC settings is to slow down the s-meter movement from bouncing around.

As I play with the Orion II, and my Omni VII, I do see the AGC on the Omni VII working when I have the RF gain set very low. I do not see this with the Orion II.

8321. Errant pixel dot on Orion II ver 3.029 display...one more clue

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-16 03:10:33 UTC
From: k7fd
Topic: 8321 Message: 8321

FYI, the errant pixel doesn't show up on the display often enough to nail down the cause...but I have determined it has something to do with the AM mode, main receiver. I know that isn't much to go on, but it appears the single dot has appeared when I have been in the AM mode. The dot does not appear until the rig has been turned off and turned on later...and then switched from AM mode back to CW or SSB.

FYI, the single dot/pixel appears in the same horizontal plane as the top of the bandpass display, just a hair left and above the 'O' mark on the sweep display.

To clear the dot, I turn the rig off and back on.

Could you send me a picture whren it happens and run backup sequence? If you can share both it would make replication a bit easier. Thanks and regards, onno

Yes fully agree. Most practical is to use rf gain.

8327. Updating firmware 565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-16 20:07:00 UTC
From: IZ4TNW
Topic: 8327 Message: 8327

Hi guys, i'm in trouble with updating my orion 565, i've cecked operating manual and download the last version of the firmware (my version is 2.064)the trx is connected to the DB9 serial port (normally i use Ham radio deluxe)
I send the new version of the firmware over my trx the Flash program start but nothing will happen.
What is my mistake?
thank you
Antonio

Topic: 8327 Message: 8328

Typical you would like to check:

1- switch off the orion, push and hold user1 button while switch on orion. this will enable flash mode

2- start flash program after you have seen step 1 to display flash on orion

3- if orion connects well the bottom right are of the updatd program will show something like orion....

4- confirm the serial cable has cts hardward handshaking wires connected. this isneeded for upgrade.

best regards, onno

From: art davis
Topic: 8013 Message: 8329

I would say that the only way to fix the clicks is to replace the relay, but even that doesn't help. I did that and I can still hear the relay clicking/chirping with my headphones on. Absolutely annoying!

Good luck!

Subject: Re: [orion565] Re: cw operation. Relay clicks....Help please.

one of my friends did a fix to a alpha 76 a with a loud relay click, he

used 2 small vacuum relays mounted in a rubber grommet and got rid of 99 % of

the noise, and it would also now do QSK

Art, you might want to review some of the older posts on this same topic. There was extensive discussion of it last year, I believe. It may have been on the tentec reflector instead of here, but some Orion's have loud relays, and others, like mine, have quiet relays. Several suggestions were made to quiet it down, but I don't recall what they were now.

The difference might be on how close the reed relais is mounted to the pcb. Perhaps some units have the relais touching the pcb and other rigs dont. The contact would make the pcb the soundboard. It might be worthwile to check. Regards, onno

Hi Onno
many thanks for your help, now the problem is fixed
best regards
Antonio

8335. RE: [orion565] Re: cw operation. Relay clicks....Help please.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-17 15:44:20 UTC
From: art davis
Topic: 8013 Message: 8335

You are correct (as usual) Onno. I actually tried off-mounting the relay about 1/2 inch above the PC board and wrapping it with foam tape which did fix the noise. But the radio was unusable on 10M due to the RF coupling of the longer leads going to the relay. But it's no real big issue, I've kinda gotten used to it as long as I use headphones which I do anyway.

And thanks Duane, I was in the middle of that discussion as well but since have progressed to other things to complain about!

73 all, Art N4UC

Subject: [orion565] Re: cw operation. Relay clicks....Help please.

The difference might be on how close the reed relais is mounted to the pcb. Perhaps some units have the relais touching the pcb and other rigs dont. The contact would make the pcb the soundboard. It might be worthwile to check. Regards, onno

Did you mount it back without space between reed relais and pcb or did you leave a tiny space between them? I guess 2mm distance between reed and pcb should not influence the 10m band? I will need to doublecheck on my unit but my unit makes little sound and I have good hearing. Regards, onno

8337. Re: [orion565] Re: cw operation. Relay clicks....Help please.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-17 20:11:14 UTC
From: Barry N1EU
Topic: 8013 Message: 8337

I can clearly hear my relay with my headphones off but I always have them
on with cw so it's not an issue.

Barry N1EU

[Non-text portions of this message have been removed]

8338. RE: [orion565] Re: cw operation. Relay clicks....Help please.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-18 01:23:19 UTC
From: art davis
Topic: 8013 Message: 8338

I re-installed the relay back down on the board but left the foam tape around it. Now 10M operation is OK again but the chirping is back. It must be coupling to the chassis through the leads. One day I'm going to try replacing the rigid solid leads with flexible stranded wire. True, I can operate with headphones (which I do anyway) but now it's the principle of the thing! I have operated two other Orions and I don't hear a thing from them, so I know it can be fixed.
I'm not going to let this thing beat me!

Subject: [orion565] Re: cw operation. Relay clicks....Help please.

Did you mount it back without space between reed relais and pcb or did you leave a tiny space between them? I guess 2mm distance between reed and pcb should not influence the 10m band? I will need to doublecheck on my unit but my unit makes little sound and I have good hearing. Regards, onno

>

>

> You are correct (as usual) Onno. I actually tried off-mounting the relay about 1/2 inch above the PC board and wrapping it with foam tape which did fix the noise. But the radio was unusable on 10M due to the RF coupling of the longer leads going to the relay. But it's no real big issue, I've kinda gotten used to it as long as I use headphones which I do anyway.

[Non-text portions of this message have been removed]

8340. ORION II Future CPU Board?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-18 03:03:14 UTC
From: John_Tn
Topic: 8340 Message: 8340

Since Ten Tec was smart by making the Orion modular with individual circuit boards for the various functions, does anyone think ten Tec will make a new Processor board to replace the current CPU's? The current CPU runs relatively fast for the Orion but I would love to see much faster CPU's in the Orion maybe 1.5 GHz Or faster? The extra Horse Power would be a welcome upgrade providing a much faster Sweep and even better Noise Blanker, Noise Reduction and other DSP related features and with the extra DSP Horse Power the orion could even take on new DSP tasks.

If they were thinking in this direction they would have done it some time back. I think it is what it is.

Too bad because it's a great receiver!

Oh, it also doesn't have AVC for my solid state amp!

I should have said in my previous response to the TT-2 CPU speed, It doesn't have AGC to control my two solid state amps.

Thanks Berry, you are right ALC.

I called TT and asked about adding it and I was told this rig doesn’t need it??? I threw the towel in after that answer.

I guess I’ve shown my age by saying AVC, hi.

I was thinking this myself a while back, when the new sub receiver boards came out. Of course it doesn't necessarily have to be Ten-Tec. Piexx seem to have done okay making replacements for the old TS930 digital board, which has been shown to be a bit flaky. They added more features into the deal and since this was the board with all the software obviously had to write the thing themselves. Of course it would be neat to see Ten-Tec do a replacement that would bring the Orion's brain up to state of the art level, with or without a new display panel, even around $1k with the right mix of features and performance I think it could be a worthwhile upgrade.

Yes Martin,
The strength of the ORION is that it's modular. Unlike the other brands they use primarily one main board for the whole rig. With the Orion it should be possible to make a new CPU board with the latest Hi-Speed DSP processors at an affordable price point. my current smart phone is a Dual Core DSP running at 1 GHz! On battery power, it should be possible to make a new DSP board for the ORION II?

I believe everyone would appreciate color screen and a tad faster control? I just wonder which features are missing which require a faster cpu? To my knowledge the cpu is all about control and has little to do with real time signal processing. You might be able to put in a very fast processor but for what purpose?

Which features are missing and will need higher cpu speed?

On the dsp the same applies and here a faster dsp might give room for more advanced signal processing. But again I am wondering which feature is missing?

the orion is not a portable rig. Hence chances are high a computer sits next to it. The computer provides cost effective ways for advanced signal processing as well for the fft adictives the possibility for nice panorama display.

To me the orion 565 would need an upgrade to 566 controller board and screen. Would provide good cash toward ten tec but comes at the cost of loosing new 566 business. I guess thats where the struggle occurs?

Regards, onno

8351. Re: ORION II Future CPU Board?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-20 12:45:34 UTC
From: floydsense
Topic: 8340 Message: 8351

Hi Onno. Time to speak out regarding the Orion II and the panoramic display. While I didn't always think this way, I've learned that the best approach to a panadaptor is to use the capabilities of the PC for that processing and the display. I first learned the value of a panadaptor when I owned an Icom 781 and crude as that one was, it ran rings around the current Orion implementation. It helped that they used an analog display and so weren't limited by the resolution of a digital display. In the past few years, I've used just about every available panadaptor approach involving the PC (LP-Pan, SDR-IQ, and all flavors of related software) as well as the Elecraft P3. I've either owned or examined closely the hardware panadaptor implementations in the latest Yaesu and Icom rigs and while they're lacking in many ways, they're better than the Orion approach.

I think the best route today is for Tentec and some of these other companies to work together to their mutual advantage. The focus for Tentec and the Orion (and future offerings) should be as follows:

1. Delivering a buffered IF signal source to the rear panel to feed an external panadaptor

2. Working with panadaptor software authors/companies to get full support for the Orion included in their products

3. Driving future developments in that software

4. Educating the Orion users and explaining via diagrams and written explanations in user manuals on how to implement the panadaptor solutions.

VE7TK did an excellent job in getting #1 done, using the Clifton Laboratories buffer amp board. I'm sure that Jack Smith at Clifton wouldn't mind selling a ton more of his buffer amps. One important aspect of the buffered output approach is that it provides reverse isolation to keep spurious signals from the panadaptor hardware from getting back into the IF chain.

In regard to #2, Orion support is usually non-existent in these software products. In some cases, the reason for that is that no one has asked the authors for it! Last year I approached the SpectraVue author at Dayton about using his software and SDR-IQ with the Orion II and he said the problem is that he didn't have an Orion to work with. I immediately promised to do the testing for him and he agreed to give it a try. After I supplied him with some basic info about IF offsets, he turned around the completed code in 2 weeks. While it isn't the perfect solution yet, I have a panadaptor that runs rings around anything from any of the other companies.

On #3, all it takes is for someone to provide basic information and help when needed. For example, if I were the Tentec rep on this issue, I'd make sure that every developer of panadaptor software had in his hands the info on IF offsets, our CAT command set, and future user requirements. Most of the hardware and software for panadaptor function today is directed at the full-function SDR receivers (SDR-IQ, FlexRadio, Perseus, etc.), but there are a few (NaP3 for one) that are specific to the panadaptor function. Someone with some industry clout needs to help guide product requirements to optimize them for the

panadaptor function.

Regarding #4: If a user wants to know how to implement an external panadaptor for the Orion today and how to connect everything, he can use the very good VE7TK document and the Help info provided with SpectraVue. Not a peep from Tentec on the subject. Tentec could provide this info in a generic form, not even mentioning specific products if desired.

And finally, Tentec needs to stop the talk about a future high-speed panadaptor that's in the works for the Orion. We've been told that for the past several years and it's obvious that isn't going to happen. That's probably just as well, as there are so many other shortcomings in the Tentec panadaptor approach that few users would opt for that anyway.

Hello Onno,
I was talking about the 566 ORION II not the 565. With a faster CPU the BUILT IN band scope could be able to scan at much faster rate making it much more useable. Now of course you can use an external pan adapter like the SDR IQ but having a built in pan adapter that works great should be included in the fine rig. OII 566 users will notice that when you start to enable NB, NR, AN and use both receivers simultaneously you will notice the sweep rate drops significantly. This is due to the higher load on the CPU, a fast CPU would make this issue go away. Now as far as "missing features", it's not that futures are missing in the OII it's just the exiting features would have a performance increase with a faster CPU as well as power for more advanced NB, NR & Notch algorithms. Now as far as "new" features you could add features like built in CW decode like the Jupiter has also you could add other built in digital mode decoding algorithms.
Now don't get me wrong I love my Orion II just the way it is. But keep in mind CPU Processors have dramatically increased in speed since the Orion was released. I believe the original AMD Shark processor ran at 66 MHz the latest one runs at over "1Ghz" and has two cores! Too me just like the latest RX-366 Sub-Receiver upgrade witch breathes new life into the Orion and is awesome a new DSP board would take the ORION to the next level. And this is what makes the Orion possibly the greatest stand alone transceiver made to date in that it's modular and upgrade able. And this concept gives TEN TEC a way to keep improving this product and keeping customers excited about the investment they have made.
TEN TEC is a much smaller company than the Japanese competitors and cannot keep designing new every few years like them. But to me this is to TT advantage by making the OII modular they can make new hardware upgrades and software updates greatly extending the life of the product well beyond the competition and is more profitable than trying to design and engineer a new rig every few years. It also gives them more time to develop a new product and once again raise the bar that the competitors will be trying to catch up to for years to come.

Floyd;

Good observation on your part.

I'm a big spectrum scope ham. With that said.

I have the Icom IC-7600 and I think it is just great. I'd like to see my O2 do the same. With the Icoms TFT screen and LED back lightening the scope is like HD TV and instant in its response. And the 7600 was designed 4 years ago or so! Anyone for USB control Icom has it?

The Ten Tec scope thing has been batted around since I owned the original Orion (565) and it never got resolved in terms of speed

I would think the modular construction of the TT Orion series lends itself to changing out modules as new technology comes along.

A year ago I bought a Yaesu FT-5000 with their scope. Nothing more than a joke and I sold that rig 2 months later.

A few years back I owned a Elecraft K3 and added the LP-100 pan adaptor. That was great but all I wanted from the software that I was using was the scope screen and not to control the K3 from that program. I never got and answer to that and sold the K3. I still have the LP-100 and someday someone will come up with a dedicated spectrum scope only window to use with my LP-100.

I'm now looking toward the new Kenwood TS-990. We'll see how they do with their scope.

My 2 cents.

George W2YJ

Subject: [orion565] Re: ORION II Future CPU Board?

Hi Onno. Time to speak out regarding the Orion II and the panoramic display. While I didn't always think this way, I've learned that the best approach to a panadaptor is to use the capabilities of the PC for that processing and the display. I first learned the value of a panadaptor when I owned an Icom 781 and crude as that one was, it ran rings around the current Orion implementation. It helped that they used an analog display and so weren't limited by the resolution of a digital display. In the past few years, I've used just about every available panadaptor approach involving the PC

(LP-Pan, SDR-IQ, and all flavors of related software) as well as the Elecraft P3. I've either owned or examined closely the hardware panadaptor implementations in the latest Yaesu and Icom rigs and while they're lacking in many ways, they're better than the Orion approach.

I think the best route today is for Tentec and some of these other companies to work together to their mutual advantage. The focus for Tentec and the Orion (and future offerings) should be as follows:

1. Delivering a buffered IF signal source to the rear panel to feed an external panadaptor

2. Working with panadaptor software authors/companies to get full support for the Orion included in their products

3. Driving future developments in that software

4. Educating the Orion users and explaining via diagrams and written explanations in user manuals on how to implement the panadaptor solutions.

VE7TK did an excellent job in getting #1 done, using the Clifton Laboratories buffer amp board. I'm sure that Jack Smith at Clifton wouldn't mind selling a ton more of his buffer amps. One important aspect of the buffered output approach is that it provides reverse isolation to keep spurious signals from the panadaptor hardware from getting back into the IF chain.

In regard to #2, Orion support is usually non-existent in these software products. In some cases, the reason for that is that no one has asked the authors for it! Last year I approached the SpectraVue author at Dayton about using his software and SDR-IQ with the Orion II and he said the problem is that he didn't have an Orion to work with. I immediately promised to do the testing for him and he agreed to give it a try. After I supplied him with some basic info about IF offsets, he turned around the completed code in 2 weeks. While it isn't the perfect solution yet, I have a panadaptor that runs rings around anything from any of the other companies.

On #3, all it takes is for someone to provide basic information and help when needed. For example, if I were the Tentec rep on this issue, I'd make sure that every developer of panadaptor software had in his hands the info on IF offsets, our CAT command set, and future user requirements. Most of the hardware and software for panadaptor function today is directed at the full-function SDR receivers (SDR-IQ, FlexRadio, Perseus, etc.), but there are a few (NaP3 for one) that are specific to the panadaptor function. Someone with some industry clout needs to help guide product requirements to optimize them for the panadaptor function.

Regarding #4: If a user wants to know how to implement an external panadaptor for the Orion today and how to connect everything, he can use the very good VE7TK document and the Help info provided with SpectraVue. Not a peep from Tentec on the subject. Tentec could provide this info in a generic form, not even mentioning specific products if desired.

And finally, Tentec needs to stop the talk about a future high-speed panadaptor that's in the works for the Orion. We've been told that for the past several years and it's obvious that isn't going to happen. That's probably just as well, as there are so many other shortcomings in the Tentec panadaptor approach that few users would opt for that anyway.

George - I see you and I have been down some of the same paths. I also had an FTDX-5000 for two months. Like the Orion, the 5000 spectrum scope bore little relationship to what was being heard and the brightness - well, there wasn't any! What could they have been thinking with a 9600 bps serial link to a "real-time" scope!

Makes sense and its a good discussion to have!

Floyd, John, George; all good arguments and something to put into our wish list towards TT. So far I have seen TT responding positive towards customer feedback. The new firmware and new sub rx is a very good step forward and extended the lifecycle again.

I would be happy to see and affordable 565 to 566 upgrade path.

Best regards, Onno

John - I don't believe that a faster sweep rate even begins to address the problem. The PC-based panadaptor applications today allow you to adjust the FFT parameters so the spectrum display can be tailored to a specific mode or application. This includes: FFT blocksize (may have that term wrong) - higher values provide higher frequency resolution, but also slows down the sweep; FFT averaging (higher values produce a more stable sweep, but with some loss of detail); FFT smoothing (smooths waveforms so SSB is more recognizable). You need knobs (or the software equivalent) to be able to adjust all of those quickly. You also need to be able to quickly set the span (a menu item doesn't cut it) and the span needs to be adjustable down to 1 KHz or so, so small details can be observed. And - a waterfall display is also very useful in spotting weak signals that otherwise might escape notice.

All these things and more are available today in software like SpectraVue for the SDR-IQ. But the SpectraVue screen is cluttered with a lot of other stuff that has no meaning with a panadaptor. It would be really nice if Tentec offered panadaptor software that worked with SDR-IQ or LP-Pan and completely supported the Orion II. It wouldn't take much to improve on what's there already and then you'd have a really first-class panadaptor.

FlexRadio is the only company that fully understands what's needed in a spectrum display but they're clueless in most other areas.

The Elecraft P3 is an excellent hardware panadaptor, but unfortunately is limited by the screen size. Some Orion II owners are using the P3 with the Orion - Elecraft had the foresight to build in the flexibility to handle other IF frequencies. So, Orion owners can improve their transceiver by adding a piece of Elecraft hardware - not something I'd want to see happening if I were a Tentec product planner.

Floyd,
Of course if you connect an EXTERNAL COMPUTER running at upwards of 3.2Ghz with multiple cores like Intel I3, I5 and I7 processor the pan adapter is going to be great and chock full of features like click and tune at that point you might as well buy a FLEX radio, but that's not the point. The idea is to make the ORION II better on its own! Without an EXTERNAL COMPUTER and this can be done by improving the CPU Power as well as other future improvements.

But, that would be extreme PC overkill for a complete suite of panadaptor functions. I use a several year old dual core Pentium with nowhere near that power and it all works flawlessly. I don't agree that the idea is to make the Orion II better on its own. I wouldn't spend another dollar on Orion II upgrades just to bring the box up to the level it is with my current software and PC. If I'm from Tentec, the idea would be to make money on hardware and if I could sell more by exploiting software already in the marketplace and PCs that are already in the shacks, that's the direction I'd take.

Even with more CPU horsepower in the Orion, you'd be left with a display that doesn't have enough real estate for a good panadaptor and without the resolution or color capabilities that the PC monitor offers. It may be possible to come up to the level of an Icom transceiver, but anyone wanting a high performance transceiver with good panadaptor would likely still go the Elecraft route.

Elecraft is an interesting example when looking at panadaptors, since those who are happy with a high-function but small screen can go with the P3, while those who want more can use a PC via an LP-Pan. Even there, note that the all-hardware P3 costs 2-3 times what the PC approach costs.

Floyd: This is about improving the ORION II. Yes if you get a PC or a MAC there is all sorts of great things you can do and the FLEX Radio System is a great example of that. However this is not a conversation about that using a PC or MAC. Again this post is not about hooking a computer to the rig it's about making improvements to the ORION on its own without an external computer. And also improving the ORION's pan adapter is just one of the improvements we are talking about here.
I love my OII just like many other owners and because of Ten Tec's modular design philosophy it IS possible to continue to make improvements and by the way a new CPU/DSP board is "hardware" and TT would make money selling it. In fact they actually will make more money selling option/upgrade hardware rather than having to come up with a whole new rig every 2 or 3 years. You know (Design, Engineer, write new Software, design a new case, make the new case, apply for new patents, get FCC approval ect ect etc you get the idea.) Again what makes the ORION and other TT products great is its ability to be upgraded, greatly extending the life cycle of the product line well beyond the competition.
I you like using a computer for HF radio there is nothing wrong with that. There are many options out there today and PC based HF radio is one of them.

I don't agree that the idea is to make the Orion II better on its own. I wouldn't spend another dollar on Orion II upgrades just to bring the box up to the level it is with my current software and PC. If I'm from Tentec, the idea would be to make money on hardware and if I could sell more by exploiting software already in the marketplace and PCs that are already in the shacks, that's the direction I'd take.

8362. thin line across display

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-24 03:36:46 UTC
From: art davis
Topic: 8362 Message: 8362

All of a sudden my display has developed a very thin but noticeable line across the screen about halfway up. It is not visible against the white background, but it does take a slice out of every character it crosses (but doesn't affect the vertical lines outlining the screen. It is really of no consequence, but I'm just wondering if it might be a firmware issue (running v. 3.030) or a hardware problem.

Thanks, Art N4UC

Hi Art,

If you press and hold the menu button the firmware screen will start. Does the line remain? can you upload a picture of the screen with line? whats the behavior of the line? is it there right away and even during the power on boot sequence of the orion? Or does it appear after minutes/ hours?

Best regards, onno

Hello Onno.

The line is very thin, about the same as the horizontal lines around the screen separating the pushbutton sections. It is there from the very start of boot-up and doesn't change in any way regardless of the time the rig is powered on. It is there when MENU button is held down to start the firmware screen. If this description is not sufficient I will gladly take a picture and send it along.

I haven't tried loading different version firmware because it sounds like a hardware problem rather than software. Do you agree?

8366. NB on 566

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-25 14:13:42 UTC
From: George
Topic: 8366 Message: 8366

I had occasion to experience the apparent Radar pop up on 18074.0 when trying to work the DX station A5A with my Orion-2.
I kicked in the NB and HW NB on the Orion-2 with disappointing results.
I fired up my Icom IC-7600 and my Kenwood TS-590 and tried their NB's and both did a much better job on the Radar.
I called my friend and he fired up his Yaesu FT1000MP and his rig also did a better job with that Radar signal???
Does my O2 have a problem?
Go to 18074.0 and listen to the sweet sound of an apparent Radar signal. It clears up at about 18085.0 but is still discernible in the background.
Good use of the ham bands!
George W2YJ

They should use the blanker that was in the Triton IV. Best one I have used.

Hello Richard, will you be on the repeter toninght?
It's funny i found the NB to be fairly good since the 3.0 update? I found useing the HW blanker for some noise works better than the DSP, But the DSP blanker works well on other noises?
When you press and hold the NB button it switches between the two modes. I never owned a triton but the orion is definatly better than my FT-2000's Noise Blanker.

Leave the tuner off John. The amp has a tuned input anyway, and the tuner will constantly try to adjust more than likely if left on while running the amp.

John.

I ran an 811H with my OII for years until just recently when I replaced it with the ALS1300.

I had no issues at all, but keep your drive at 75 watts or below, as you have no ALC to the amp.

I was getting about 800-850 watts PEP no problem. Very reliable amp.

8382. RFI in headphones

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-29 18:17:32 UTC
From: obeegin
Topic: 2919 Message: 8382

Hello to the group. I just got a used Orion II built in 2005.
I'm having a few issues and have some questions.

First and most important is RFI in my headphones.
It really makes CW impossible with headphones... not cool!
I'm getting a STRONG Buzz/Humm when using CW. I have not
noticed it with SSB but haven't really done much voice.
This is what I've noted so far:
- it does not occur with the speaker on the rig
- hooked up my Eagle to the same coax line and it does not occur
- the worst on 40 mtrs but still there on all bands
- tried changing the coax length with no change
- it is worse on my vertical antenna but still heard on my OCFD
- I am using Senheiser, Yamaha, Klipsch phones - all similar results

I looked this problem up on this forum and others and there was a "board"
added to deal with similar issues, as far as I can understand.
I called Ten-Tec and asked about the "board" they said that was a
"different" issue than this.
This was their take.
- it could be an inadequate power supply
I'm using an Alinco DM-330MVT
- poor shielding of the headphones
- I asked if Ten-Tec phones would work better and they said probably not

So I will try some ferrite beads and hope that works.
Any other ideas. I have days to wait for beads to come to my rural QTH.

Interesting challenge and I hope you can resolve it soon. The beads are often the cure for most rfi issues.

I recently homebrewed a ground tuner which deflects any rf in the shack to a radial in the shack. I am at second floor and rf ground is a challenge. It cured rfi around me in the shack.if the beads dont solve it this might be a direction to investigate.

I am surprised though the headphones are so sensitive to rfi. Often rfi occurs with microphones and such like. No rfi on the mic signal? The headphone modification includes two resistors to increase the headphone impedance. This to minimize the noise. There is a headphone service update provided on tentec website.

Best regards, onno

That sounds like a good idea.
Where would I get the microphone cord?
I guess I could call Ten-Tec and see if they have one.

One other thing Paul mentioned is that I may have too little or too
much grounding. He thinks that I may have "over" grounded my rig.
I have it grounded to two 12 ft. rods pounded into the great Utah soil.

Thanks for the input guys!
I really appreciate it. It's been a rough day at work and this whole
issue just has me frustrated. It's discouraging putting out so much
money for a radio and having such an obnoxious problem.

From: ve7tk
Topic: 8387 Message: 8387

I have just uploaded a JPG of the Orion 565 with RX-366 and an LP-Pan.

The photo shows an S-8.5 signal at 14.225 on a busy 20 metre band. The software is TRX-Pan. The only oddity with the RX-366 / LP-Pan combination is an S-9 birdie at about 14 kHz below the primary signal. (Ten-Tec is aware of this issue.) Otherwise the RX-366 is excellent and the 192 kHz bandwidth is pretty well flat.

The other hardware used in this demo was an LP-Pan Panadapter with a LP-Pan Preamp acting as a buffer and adding the necessary gain to the RX-366's 9 MHz IF.

I bought my cord at Radio Shack, but there should be better stuff available.
You need two conductors plus the shield.

Stan

One thing TEN TEC told me when I purchased my Orion II was to keep the power cord as short as possible due to them having problems with RF getting in on the 12 volt supply cable. Just something to look into. However, the buzzing sounds more like a cable grounding problem as others have suggested.

That does seem to be the group consensus.

I'm assuming the RFI is originating from the Orion not the coax
since my Eagle and my Scout don't have the same issue.

Does anyone know of a set of headphones that would have a good ground
already in place? I was looking at my headphones and I'm not too keen
on cutting up my $200 Senheisers. I've had a pair of Heil Proset elite
and they were VERY uncomfortable. I can wear my Senheisers for hours
without any issues.

Hi Stan,

Does the rfi change when you touch the chassis? Does the rfi change if you touch other devices such as power supply, speaker, antenna tuner, grounding connection in your shack?

First thing to do is disconnect all optional wires connecting to orion. Speaker, line out, serial cable etc. Leave the antenna and power connected. Problem still there?

Reason I am asking is that rf might be sneaking into your systems through various ways. If you have a rf amp meter (read 3 turn coil, diode, capacitor, potentiometer and analog vu meter) you can measure the current towards your ground rod during transmit. While transmitting touch your chassis and such like. If the current changes the rf is not only going to your ground rod.

In my shack most devices influenced the rf going into my ground system. Than I included the beads on every wire connecting to the orion -except- the ground wire. After that I could touch the power supply and such like and the current towards the ground did not change anymore. The current to the ground system also increased through this change.

Not related to rfi but one warning I would like to included.... especially the serial connection is sensitive towards high voltage discharge. This can happen when connecting a floating computer to the serial port. Please make sure that computer chassis shares the same earth as the orion prior to connecting the serial cable. I once made the mistake of using a computer on the other end of the shack which was not connected to same mains ground and poooffff... the serial controller chip died on me. Just something to be aware off...

Best regards, onno

Thanks for all the help and messages both on the board and private.

I disconnected everything from the rig except one antenna (the vertical),
the key (Bencher), a single ground connection directly to one rod, the
power was replaced with a fully charged deep cycle 12V battery.

I think there was less of a buzz, but not a major improvement.
Still can barely hear the carrier over the buzzing.

I did make a few SSB contacts with that configuration and got great signal reports.
So RFI is not getting into the Mic (Ten-Tec 707).
I don't hear any buzzing while monitoring the SSB output.

It's still pretty uselss for CW and headphones!
But it is fun to have a challenge.

Thanks for the heads-up on the serial connection onno.
I will be careful.

Thanks again guys.

Hi Stan,

Does the rfi change when you touch the chassis? Does the rfi change if you touch other devices such as power supply, speaker, antenna tuner, grounding connection in your shack?

First thing to do is disconnect all optional wires connecting to orion. Speaker, line out, serial cable etc. Leave the antenna and power connected. Problem still there?

Reason I am asking is that rf might be sneaking into your systems through various ways. If you have a rf amp meter (read 3 turn coil, diode, capacitor, potentiometer and analog vu meter) you can measure the current towards your ground rod during transmit. While transmitting touch your chassis and such like. If the current changes the rf is not only going to your ground rod.

In my shack most devices influenced the rf going into my ground system. Than I included the beads on every wire connecting to the orion -except- the ground wire. After that I could touch the power supply and such like and the current towards the ground did not change anymore. The current to the ground system also increased through this change.

Not related to rfi but one warning I would like to included.... especially the serial connection is sensitive towards high voltage discharge. This can happen when connecting a floating computer to the serial port. Please make sure that computer chassis shares the same earth as the orion prior to connecting the serial cable. I once made the mistake of using a computer on the other end of the shack which was not connected to same mains ground and pooofff... the serial controller chip died on me. Just something to be aware off...

Best regards, onno

8395. Finally getting used to my Orion II

Yahoo group: orion565 (2009 — 2013)
Date: 2012-05-30 16:36:29 UTC
From: Phil Sikes
Topic: 8395 Message: 8395

Now that I have had my Orion II for a few weeks I am finally getting the hang of using it. It did take a while to figure out that reading the manual from cover to cover was a good idea! It almost took too long as this was the time period that Yemen was on the air and I needed them for one of my few new ones (# 323 finally in the log). I was having some serious fits trying to hear them and blaming the rig for every fault that came along. I finally figured out that I had a small piece of very crappy coax in the chain. Once it was removed things did improve. I was still having a mismatch problem between the rig and antenna on 15 meters which made no sense because the antenna (KT-34A) is spot on there. I finally traced that problem to the antenna tuner. In bypass it was causing a VSWR problem that appeared as a mismatch at the amp input. Strange things going on in the world of HF and ham radio.

Once I finally got the gremlins out of the system I finally had some time to read the manual and learn how to use the O II to good advantage. Also, thanks to the forum for some great ideas and thoughts on using this great rig. Still enjoying the LP-Pan too.

From: obeegin
Topic: 2919 Message: 8396

Problem Solved!
Thanks to you guys and despite of myself.

I finally took onno's advice and started touching things.
I just could not believe something not connected to the rig could be
the problem... WRONG!

Despite having disconnected everything from the rig I had not
shut off all my electronics in the shack.
First I touched the rig and the buzzing changed.... higher pitch
Then I touched my amp and it changed again.
Then I touched my computer and it drastically changed... quieter.
So I shut down ALL my electronics except the Orion and it DISAPPEARED!
After about 30 minutes of plugging, unplugging trying different cords
I narrowed it down to a wall-wart for my USB hub.
My laptop supply also causes an almost unacceptable hmmm when plugged in.

Now if someone can explain to me how a wall-wart causes a horrid hum,
only in my headphones, only on CW, only during Tx, I'd really
appreciate it.
THAT was not on my Extra Exam!

Thanks so so much you guys. As a lone ham in rural Utah you really
are my only source of help and I assure you I would not have figured
it out without your assistance. I have more questions but I'll let
you guys alone for a while.

Phil

I love my Orion II also.. The learning curve was steeper than an other radio I've ever owned, but well worth the effort. It takes a bit to get used to the adaptive nature of it, meaning unlike an analog radio when you make certain adjustments the dsp software proccesses this for a bit instead reacting immediately like an analog radio does.. It would take a radio head and shoulders above it's capabilities for me to sell my Orion II.

I absolutely agree, it will take quite a radio to make me give up my O II. A friend has a Flex 3000 and as nice as it is, I will keep my O II, same for my friend with the K3 that I got the Orion from, I would take the Orion in a heart beat. Once I got the hang of this rig I could not imagine anything beating it out in a listening contest. I have had some good rigs in the past (FT1000MP, Omni VI+, etc), but this one beats them all.

Intriqued by the issue and if you have time I would appreciate if you could perform the steps below and report back. We might have found the source of missery but not yet how it actually propegates into your headphone...

With the external humm generators connected and operational please test the following.

1- disconnect -all- cables except power, antenna cable, ground rod and headphone.
2- auto tuner disabled and pressing tune and pushing pwr button the orion should transmit carrier only. Please check output towards your amplifier to avoid overdrive. Does the humm still occur?
3- how is the cw key normally connected to orion? Is the cable shielded and how long is the cable? When connecting just a 3.5mm plug into the cw port and bridging with a small screw driver does the humm also occur? When connecting a capacitor over the cw plug (10nF or bigger) does the humm stop?

The humm might be introduced through the cw cable somehow. It might be close to the undesired humm generators and as such pick up the humm. If you could test and provide feedback that would be great. Trying to zoom into root cause analysis.

Best regards, onno

Man I love my 565 and now I am running it with my Hercules II which makes it a joy to run a little power thanks to the Herc. Solid state amps like the Herc are great. Today I upgraded to the new LDG AT 1000 Pro II and it is a great auto-tuner. TT ought to bring back the Herc. I'm sure they can make one that would compete with the Tokyo HP 500 watt model or ALS 600, etc.

Come on Paul fire up the R&D, get some new final PA's, and bring back this great little amp! You'd sell a bunch I bet.

Does anybody else run a Hercules II? I hope your experience with it is as good as mine.

From: chubso81
Topic: 8411 Message: 8411

I upgraded from 2.044 to 3.029 last week and I noticed that the sweep seemed shifted left. LSB signals are well left past the 0 line and USB shows on top and maybe some to the left of the zero marker.

I reverted back to 2.044 and the problem went away.

I like the improvements and can mentally adjust so I'm sticking with 3.029 for the time being.

Has anybody else noticed this or is it my O2?

Thanks 73, JP, K8AG

JP: Just checked out my Orion II with 3.029 loaded. YES! I have the same issue on mine.

It's not that bad, and I noticed it after I upgraded, but it is a small issue to me.

What I would like to see is a marker like the Omni VII has. It lets me return back to where I was without remembering the frequency.

http://en.wikipedia.org/wiki/Sideband

It appears correct on my scope. Lower sideband shows to the left of the center carrier frequency, upper shows to the right. CW is pretty much centered.

That said, I use the display strictly as a way to judge overall activity on a given width of specturm. In my book, it's just not detailed enough to use it otherwise...

That means that our O2s are different. I understand sidebands. I have been using the radio for about 18 months, been a ham for 35 years, was a broadcast engineer in the 70s. Like I said I can mentally ignore it. But it bothers me. It isn't a simple imbalance. The USB signals, properly tuned in, show up almost centered in the display. LSB are way on the left.

I am an embedded systems engineer by trade for many years and we deal in fixed-point math. This looks like possibly a fixed-point resolution problem.

Oh well. Some have the problem and others do not. Thanks for all of the responses.

From: Jerry Rogers
Topic: 8411 Message: 8417

Update to the sweep on my Orion II. I've only owned mine for two months, so still a lot to learn.

I've noticed that if I rotate the PBT or the low side of the CUT control it shifts the sweep display from the center line. It's not that great on the sweep display, but it make me wonder if even though the signal is tuned in correctly if some kind of tracking is off.

Thanks Jerry. I think that is it. The upgrade simply moved things slightly to the left. With the PBT it is a non-issue.

Thanks to all who responded. 73 JP, K8AG

8419. UK spares stocks and repair facility?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-06-17 22:07:37 UTC
From: Chris Wilson
Topic: 8419 Message: 8419

I am thinking of getting an Orion II or an Omni VII. I am in England
UK and need to know what spares are held in the UK and who is
an official repair agent over here please? Thanks.

The LP Pan is factory built, configured for an Orion, and has a custom crystal from Telepost that centers the IF in the passband. The original crystal is also supplied if you want to change back to the original configuration.

These work perfectly and were both in service at my QTH until a few days ago when I reconfigured my shack.

$225 firm via Paypal including Priority Mail shipment within the US.

As far as I know the fine people of aoruk provided this excellent service but unfortunately they closed the shop. Next distribution point is Germany but I am not sure if they are just a sales representation or service point as well. best to raise the question to tentec usa by sending an email to their service department. regards, onno

HI,

Walters and Stanton took over the agency from AOR, however I have no idea what sort of spares they hold. Great shame when AOR dropped TenTec, bought my ORION from them and always found their service to be excellent.

Waters & Stanton PLC, Spa House, 22 Main Road, Hockley, Essex. SS5 4QS. UK. Tel +44(0)1702 206835 Fax +44(0)1702 205843

8426. Orion I Loss of VFO B Audio -- A Partial Solution

Yahoo group: orion565 (2009 — 2013)
Date: 2012-06-25 16:08:22 UTC
From: al7cr
Topic: 8426 Message: 8426

I wish to help others with this problem deal with it rather than (re)start a discussion as to whether it exists or is due to improper rig operation. I am running software version 3.032 on my Orion I and the problem is real and absolutely correlated to activity on the rig com port.

The problem in my case is NOT related to a weak rig battery, though I have had that cause the problem also. My battery is a fresh new one purchased from Ten Tec.

The loss of audio in my case is NEVER cured by repeated ram clear, master reset, clear user data, reboot cycles nor is it cured by reboot cycles alone.

The problem is often cleared by rebooting with the USER 2 key depressed to enter the flash mode and then simply exiting this mode.

The problem is often cleared by rebooting with the cable to the com port disconnected but never when rebooting with it connected.

Finally in my experience the problem is always cleared if the rig is rebooted into flash mode with the com port disconnected, exiting flash mode, powering down, reconnecting the com port, and rebooting the rig.

I believe that accessing flash mode to clear the problem makes sense in that it is related to usage of the com port and accessing flash mode also uses the port.

Hopefully the above will be of use in recovering from the problem until Ten Tec can isolate and eliminate it.

Topic: 8426 Message: 8427

When my loss of VFO B started it seemed to appear about the same time of a update from TT and update of logging software I use (DXLab). I had just started using DXL and had not noticed the loss of VFO B audio, but I had not had that issue with Logger32 which I used for several years prior. But as I said, a change of logging software and change of firmware at the same time..WHO KNOWS??

But after rebooting SEVERAL times, which did clear the issue up until I clicked on a station working split, Onno PA1AP did point me in the right direction. For some reason the SUB RX was not being "turned on" when I was working split so loss of VFO B audio. What happens is that I can hear what is on VFO A thru VFO B (remember SUB RX is off on both A & b).

For whatever reason this started I now know that when I do not hear a signal on VFO B..LOOK AT THE SUB RX!! One of those quirks I am living with, but no more rebooting

terms "main rx audio" and "subrx audio". In this thread, does "VFO A
audio" mean "main rx audio" and "VFO B audio" means "subrx audio"?.

Main rx and subrx can each be assigned to VFO A or VFO B at will.

At least John took the time to describe his findings and thats a good start for a forum discussion.

You raise a good point on the difference between main and sub receiver regarding vfo assignment. Both receivers can be assigned either vfo a or vfo b. Sub receiver has another special trick where it is possible to detach it from a vfo.. rendering the sub receiver useless.... never understood why that has been implemented...

The remote software resulted in disconnecting the sub receiver from vfo assignment. Hence the advice to check vfo assignment when sub rx is dormant.

But it seems the originator of this topic has a different issue. It would be good to understand the exact software used, its version, the orion configuration parameters and perform root cause analysis to see if we can reproduce. If it is firmware we should be able to reproduce the effect.

Best regards, onno

Hi Martin,

I uploaded picture of original battery to photo section. Look for orion battery folder. It provides all information. If spareparts are an issue to get i know another ham opened the battery case and replaced it with a 3023 battery or something like that. Please note both battery and clock are used by orion. Best regards, onno

You can easily order a new battery from TenTec. Or, you can get a larger and more robust battery from DigiKey. The DigiKey battery is what I used and the specs indicate it will last a lot longer than the original battery. Both batteries are "snaphat" types and either will work just fine.

Hi Everyone,

I'm currently using my Orion II with firmware version 2.044a without any problems. I feel since I rarely ever use the second receiver, I've decided not to upgrade the receiver.

Will I gain anything if I upgrade to the new firmware version 3.029 or is it primarily for Orions with the new second receiver?

Yes, you should do it because the radio works better with the latest firmware. It corrects a number of problems.

8439. Headphone audio disappears

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-11 04:32:26 UTC
From: John Hudson
Topic: 8439 Message: 8439

I had a new issue(for me) pop up accidently tonight. I was playing around with the BINRX while listening to a 3B8 station and set the BINRX to MAIN and just pressed the NOTCH (SAF ON) button and my headphone audio disappeared! Nothing.. I turned the rig off then on (NO RESET) and the audio came back fine. I did it twice more and the same issue. External speaker works fine, just headphone audio disappears

Running Orion 1 - ver 3.032

Just wondering if anyone had that happen or can make it happen on their rig or it's just another little character flaw in my family!! It's not a operating issue at all just strange

73

Hi John I had the same issue head phone audio drpped out as soon as I switched the BIN RX on. I corrected it by reloading 3.025 and then 3.030 then 3.032 at the end of loading 3.032 part of that process is a master reset. Do not do another master reset as normal.

Thanks Wayne, I got it back now but had a little scare last night. After I sent the email out I just had to try 1 more time to recreate the problem. When I did something else happened, my VFO A went dead! Just as if the coax was disconnected. I could hear a station on VFO B but not on VFO A. I had not signals at all on VFO A. I tried to reset a couple of times and nothing It was about midnight and I just turned the rig off and got up this morning and fired it up and the same thing but I reloaded my setting using Onno's Orion Restore program and the both recvrs are fine now.. WHEW!! Weird stuff!

It's all good now

Thanks

John

Onno, does your software work with Windows 7? If so I am very interested in trying it out.

Thanks - Phil N7UX

Thanks Wes,

I updated my Orion II to version 3.029 and like it so far. I had trouble updating with my Windows XP machine and one of my Windows 7 machine. Finally got things up and running. Guess the new update software is touchy as I have no trouble controlling my O2 with both my machines using the N4PY software.

73,
Bill/K1FPV

Hello Bill,

You are experiencing hardware issues in the computer, not a problem with the firmware. Continuous stream of data can be clipped by hardware that receives Interrupts to service something else. You won't see this as an issue with software like N4PY, HRD, logging programs, etc. because they do not require the full attention of the processor for long (relative) periods of time without interruption.

Anyway, no worries about the firmware. If you get a handle on what is going on inside your computer, your situation can be resolved. You might be surprised the number of things happening in the background on most computers when you think the computer is just sitting there.

Gene / K7TXO

HELLO,

I WAS WONDERING IF ANYONE OUT THERE COULD TELL ME WHAT IS REQUIRED TO CONNECT THE ORION ON HRD. I CAN GET IT TO WORK ON N4PY SOFTWARE AND I WAS ABLE TO USE THE USB TO SERIAL CABLE TO

SET UP FIRMWARE UPDATES BUT I CANNOT GET IT TO WORK ON HAM RADIO DELUXE. ANY HELP WOULD BE GREATLY APPRECIATED.

I use it on my Orion and have no problem.

Which version of HRD are you using?
Are you using a serial port? Which Com port?
Are you using the 56K rate?
How have you set the COM port's signaling?
Is this the same set of settings that you use with N4PY?
What operating system are you using?
I assume that you are not using another program
requiring the port that N4PY uses simultaneously
with HRD.

Harry,

I have an Orion 565 (classic Orion) running with the latest HRD (ver 5+ something).

At first, I could not get my Orion to successfully do the HRD initial "connect" sequence operation. But, after some reading, I found that HRD 'resets' the USB-to-Serial interface control line states for DTR, CTS, and RTS to an 'off' state. Other programs, like N1MM or N4PY do not seem do this.

The USB to Serial cable I use (and you may be using a similar type) needs to have its RTS line set "on", to supply power to its chips, allowing communication between computer and radio. HRD has a setup 'setting' to turn-on the RTS line before attempting to 'connect' (which includes things like trying to read the frequency of the orion vfos)

Suggest you check the HRD interface 'control line' setting on the 'Connect' options.

Gud Luck, 73,

Ben - WB2RHM

Good Morning,

Thank your for the Info. It worked fine once I picked the Eagle First then I chose the Orion and it popped right up. I really appreciate the info. I just picked up my orion 565 last week and I am very pleased with it. I did do the firmware updates . Again thanks

Subject: [orion565] Re: SETTING UP HAM RADIO DELUXE ON THE ORION

Harry,

I have an Orion 565 (classic Orion) running with the latest HRD (ver 5+ something).

At first, I could not get my Orion to successfully do the HRD initial "connect" sequence operation. But, after some reading, I found that HRD 'resets' the USB-to-Serial interface control line states for DTR, CTS, and RTS to an 'off' state. Other programs, like N1MM or N4PY do not seem do this.

The USB to Serial cable I use (and you may be using a similar type) needs to have its RTS line set "on", to supply power to its chips, allowing communication between computer and radio. HRD has a setup 'setting' to turn-on the RTS line before attempting to 'connect' (which includes things like trying to read the frequency of the orion vfos)

Suggest you check the HRD interface 'control line' setting on the 'Connect' options.

Gud Luck, 73,

Ben - WB2RHM

Subject: [orion565] Re: SETTING UP HAM RADIO DELUXE ON THE ORION

I use it on my Orion and have no problem.

Which version of HRD are you using?
Are you using a serial port? Which Com port?
Are you using the 56K rate?
How have you set the COM port's signaling?
Is this the same set of settings that you use with N4PY?
What operating system are you using?
I assume that you are not using another program
requiring the port that N4PY uses simultaneously
with HRD.

Thanks Gene,

The computer I finally used was a stand alone machine, so what you say makes much sense. It is ironic in that the first computer I used, I control the Orion II using the N4PY software as well as HRD 5.11 without any issues. Next time I update, I might try disabling everything but the virus protection and the update program and see what happens.

Thanks again for the info and have a great weekend!

8457. RF Power menu options for Orion?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-15 16:22:59 UTC
From: John_Tn
Topic: 8457 Message: 8457

I wish the Orion had a menu option to adjust the maximum RF power "Limit" to say 5,10,25,50 & 100 Watts like many other rigs.
I would like to have this feature because most of the time I don't want to drive my HF Amplifier with more than 50 Watts and it is easy to accidently turn the RF power knob over that especially when contesting and you have to work fast.
Also for those QRP'ers you can just lock the rig to 5W MAX.
Does any think this could be added to a future OS update?
Anyway just a whish .

John

Hi John,

Well, if you have an accurate watt-meter, you can make a chart much like I have. My Orion II when I reduce the power level to # 1 on the PWR button, the output is between 3.35 and 4.20 watts depending on the band in the CW mode. As you adjust it upwards, it increases in each step from #1 to #100. At #100, it is between 95.5 and 101.6 watts depending on the band as measured on my Telepost LP-100A Digital Vector Wattmeter. The meter was compared for accuracy against a calibration standard and was within 2% accuracy.

Just put your Orion in the CW position and start keying at power level #1 and work your way up to make the chart.

The menu controlled pwr limit would need to be band specific due to differences in output power per band. Indication of 50 watts on 40m or 10m will result in different power out values. Perhaps it could follow the same as the mic settings which can be per band or global too... regards, onno

Yes Onono, Mic and RF power per band would be awesome!

Maybe I should have added the word "Relative" RF output power. Now of course the Actual RF power will vary due to band and loading but just like on many other rigs on the market (Yaesu, Icom, Kenwwod, and Elecraft) they offer a menu option to set the "Relative" maximum RF output power and yes even those rigs when they say 50W doesn't mean exactly 50W. I didn't mean Exact to the watt I just meant "approximately".

So for example if the rig had this menu option to say set the max output to 50W that would be measured as 50W into a perfect 50 ohm load.

Now if you wanted to expand on this idea you could say add band specific RF power settings and if you wanted to be really fancy allow the user to set a maximum RF power anywhere from 1 to 100W this way if you use a calibrated RF power meter you could set the "Actual" / "Exact" output power to just where you want it.

8462. Orion 565 LCD Contrast & Power Distribution Board

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-19 13:41:36 UTC
From: Rick W
Topic: 8462 Message: 8462

For the last several months my Orion (565) has had a screen contrast problem at start-up. Last week I noticed that is was still there but somewhat quicker than it was in the winter months. I thought perhaps I was imagining things so I shut down the rig and rebooted. The screen came up at the correct contrast immediately.

What was going on? The following morning when I turned on the rig I timed the process. Virtually a white screen at start-up and then some contrast at 30 seconds and close to full useable contrast after 2 minutes. Putting all this together suggested something in the circuit was responding to ambient temperature. It was time to dig out the schematics.

The first thought of a culprit was C700 on the logic board (Schematic A7 sheet 15 of 16). C700 is in the contrast line to the LCD and immediately follows the hardware contrast adjustment pot. If this capacitor was leaking or had some temperature stability problem it could be the culprit. I replaced the 4.7 uF @35VDC capacitor but nothing changed.

I felt that my LCD screen was likely good since it was relatively new. So I began to look elsewhere and noticed that the "bottom" of the contrast pot and one end of C700 were tied to VEE.

VEE is generated on the infamous power distribution board and nominally is about -20.5 VDC. So with the rig cool I monitored the VEE at start-up. In a period of 2 minutes it slowly climbed from about -18.5 VDC to -20.1 VDC and then stabilized. This timing matched my Orion screen contrast.

I looked at the power distribution board circuit (schematic A9) and replaced C1 (100 uF @35 VDC) and C3 and 4 (10 uF @50VDC).

After an overnight cool down of the Orion I am happy to announce that this morning there is NO delay in reaching full usable screen contrast at start-up!

There are other options.

I use N4PY software to control my Orion 565. Per band mic and power settings are maintained by this external software.

8464. Lost 5VDC supply

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-19 21:11:40 UTC
From: n4uc_2
Topic: 8464 Message: 8464

All of a sudden, I lost the 5VDC output from the A9 PS board. The -20.5 V to the display is still good. The voltages around the NTE378 are all 13V or greater. The 13.8VDC input to the board is still good.
Anybody have an idea what the voltages around the 5V section of the board should be?

TNX, Art N4UC

Greetings to the group:

After deciding to clean up the rat's nest of cables behind my rigs (what was I thinking?) I began to remove cables from their respective plugs on the back of my 565. All was well until I pulled the 1/8" stereo plug from the CW jack. Something didn't seem quite right and a closer look revealed that the plug was missing its tip.

Yup. The missing tip is still in the jack.

The jack is completely covered with plastic, so accessing the lodged plug tip from the interior of the radio is out unless there is some way to open the plastic jack housing without destroying it. At this point, I am faced with ordering and installing a replacement jack, a procedure which will require removing the back panel of the radio. Since I have nothing to lose at this point, I am also contemplating super glue on the end of a toothpick, or trying tiny drill bits to grab and extract the lodged tip.

Does anyone have prior experience with this? Any ideas or suggestions?

OK....you can stop laughing now.

WOW Mike you're right, I haven't heard of that one before… BUT be careful with the drill bit ideal, you don't want any metal shavings to fall into unwanted components. I've had the back off mine and cannot tell you what's right in the area but I know Murphy lives in my shack and if it can go wrong, IT WILL! Be care when you remove the back, lots of jumper wires and some are short so not a lot of working room but it's doable. I had to replace the DC cable to the power board so there's room but be careful when removing.

Another ideal kinda like the super glue, maybe a new pencil that is flat and take some type of epoxy and that will give you a larger area to grab hold of the tip

Good luck

John

Hey Mike,
That's a though problem to fix easily. Now there a few things you can try, 1 is to fish a very thin piece of wire into the jack and try to hook onto the tip that's stuck in the jack and pull it out. 2 I'm not sure what the jack looks like in the board but sometimes there's a way to get to the back of the jack and push the tip out with a tiny jewelers screw driver. But what I really recommend is that you just order a new jack from ten tec and just replace it because even if you remove the tip from the jack I may get damaged trying and definitely don't put glue in the jack that won't work.
The jack will only cost you a few dollars and a few minutes of you time to replace.
Good Luck

Perhaps you can use gravity in your advantage? turn the orion with the front to the floor and poke with a small and stiff wire (paper clip) into the hole. if the tip is floating it might just fall out. Regards, onno

> Hey Mike,
> That's a though problem to fix easily. Now there a few things you can try, 1 is to fish a very thin piece of wire into the jack and try to hook onto the tip that's stuck in the jack and pull it out. 2 I'm not sure what the jack looks like in the board but sometimes there's a way to get to the back of the jack and push the tip out with a tiny jewelers screw driver. But what I really recommend is that you just order a new jack from ten tec and just replace it because even if you remove the tip from the jack I may get damaged trying and definitely don't put glue in the jack that won't work.

Good Morning,
looking for some advice on transverters for use with the Orion , Interested in 2 meter and 6 meter . Any info would be appreciated.

Perhaps you can use gravity in your advantage? turn the orion with the front to the floor and poke with a small and stiff wire (paper clip) into the hole. if the tip is floating it might just fall out. Regards, onno

Perhaps combined with using a straw (milkshake) to push all internal contacts away... I think the mcdonalds straws might have the correct diameter for this.

8474. Re: Transverters

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-21 18:43:42 UTC
From: k1fpv
Topic: 8470 Message: 8474

Hi Harry,

I've had good luck with the Elecraft Transverters on my Orion II. You can set the input levels inside the transverter correctly for the transverter output port on the Orion. I'm assuming the original Orion has a similar port. My Orion II makes a great IF strip for the transverters. I use the transverters on, 50, 144, 222, and 432 MHz. They work great!

73,
Bill/K1FPV

8475. Headphone Audio AGAIN

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-26 05:33:28 UTC
From: John Hudson
Topic: 8475 Message: 8475

Ok a few weeks ago I was bothered with the low audio on the headphones on a O1 ver 3.032. Same as I think for others, speaker is loud but audio in headphone (Heil ProSet Plus) is about half audio and O1 volume has to be turned all the way up. Even with the SAF on it's not loud enough at times.

By accident I found out that if I turn on the BinRx I have a couple of situations.

1. If SAF is on and I turn on BinRX - Headphone audio goes off (I have to turn the rig off then on, no reset required)

2. If SAF is on and I turn on BinRx - Headphone audio is louder (sometimes this works but not often)

3. If SAF is OFF and I turn on Bin Rx- the headphone audio is TWICE as loud. Much louder than SAF on!

I'm guessing others have this issue too? I could not find the dits & bits email address but if someone has that I'd like to send this to them or can pass this along to John Henry

Thanks

John

It's been a while since I did this, but there's a series dropping resistor
at the headphone jack that can be bypassed or reduced to get more headphone
output. All you need to do is drop the front panel.

8477. Orion with SDR-IQ

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-26 12:59:42 UTC
From: joe_word
Topic: 8477 Message: 8477

I have purchased an Orion II that will be here next week, I want to use my SDR-IQ receiver and SpectraView software as a detailed spectrum/band scope. I see articles about using splitters or buffers, could I just dedicate the sub-receiver, as the driver for the scope, and not use a splitter or buffer? (yes, I know the Orion has a band scope, but I want higher detail). The SpectraView software has a selection for Orion/9 mHz.

If this can be done, how do I hook it up?

Thanks,

Joe N9VX

Rich,

Ten Tec had a setup like this at Dayton this year. Big screen and outstanding spectral view using a 9mHz output kit.
You may want to contact John Henry at: jhenry@...

hi joe

i mod'd my orion to be able to bring out to the spare rca connector
the sub receiver antenna connection..and use spectra view to sync orion and the sdr-iq...

this is NOT the 9mhz mode but actually adds another receiver(sdr-iq) to the orion setup ..
thus sharing same antenna the orion uses

see file name orion_mod_spare.pdf in the files section. which has lotsa pictures which should make it easier to see what is being done.

this is a simple plug-n-play mod

Thanks Paul,

In your set-up an RF Splitter is required, could I eliminate the splitter and use the sub-receiver a dedicated SDR-IQ driver?

Joe N9VX

I am presently re-arranging the shack to put this big thing!!

Hi John,
Your original report of low audio on the headphones was added to the Orion 565 list of issues. I will see that these additional observations are added to your original report.

Thank you for reporting this. TenTec does review reported issues, and they are typically addressed during the next software update cycle.

The Orion already has per band mic and power settings. I think you're asking for a scaling factor so that the actual power was a fraction of what is displayed by the PWR pot. Personally, I think this would be a confusing feature for the average Orion user, adding a level of complexity. In other words, the displayed power value is not the actual value - you need to go into the TX Menu and read the scaling factor and multiply the displayed value by this. If that's what's being contemplated, I don't think so.

8488. Re: RF Power menu options for Orion?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-07-27 23:43:42 UTC
From: John_Tn
Topic: 8457 Message: 8488

Now I understand that the RF power reading on the Orion is arbitrary scale meaning that 50 does not represent 50 Watts.

Maybe I should have added the word "Relative" RF output power. Now of course the Actual RF power will vary due to band and loading but just like on many other rigs on the market (Yaesu, Icom, Kenwwod, and Elecraft) they offer a menu option to set the "Relative" maximum RF output power and yes even those rigs when they say 50W doesn't mean exactly 50W. I didn't mean Exact to the watt I just meant"approximately".

So for example if the rig had this menu option to say set the max output to 50 that would be measured as 50W into a perfect 50 ohm load.

Now if you wanted to expand on this idea you could say add band specific RF power settings and if you wanted to be really fancy allow the user to set a maximum RF power anywhere from 1 to 100W this way if you use a calibrated RF power meter you could set the "Actual" / "Exact" output power to just where you want it.

hi joe

i have read on other boards that some have just used a T-connector.
BUT
I would NOT recommend a T-connector but I highly recommend that the rf splitter be used because it provides isolation between the electronics of the orion from the sdr-iq...you never quite know where dc will flow if something goes wrong...

i picked up the rf-splitter of ebay for $20
that is cheap insurance

also from a performance perspective
the rf-splitter assures proper input impedance for both receivers...

i have found having three receivers available a great asset...when hunting dx on cw i run the sdr-iq running cwskimmer to scope out the pileup..use the subreceiver to hear the station that cwskimmer indicate was just worked..and of course the main receiver is listening to the dx station...

then there is seeing what the other bands looks like while in a ssb pileup

of course you can just use the sdr-iq as a panadapter too
but it can do so much more

From: joe_word
Topic: 8494 Message: 8494

Is the external speaker jack on the back of the Orion II a stereo or mono plug? Ten-Tec told me it was stereo and to use the tip and sleeve, but I do not see this in the manual, thought they may have meant the phone jack on the front panel.

hi joe

cost was $45 for custom cables by "The RF Connection"
http://www.therfc.com/
and
$20 for the rfsplitter(1-100mhz) off ebay

the tmp connectors are what are used in the orion

the rf splitter i got just happen to have bnc connector
but i have seen them on ebay with other types of connectors

so my cables were bnc on one end and tmp on the other and i dont remember the coax cable i spec'd..but same as use in the orion

on the rf splitter..make sure it cover the HF band..1 thru 100mhz
and NOT the standard cable tv splitter which cover 300-2000 mhz

the rf connection guys were great to work with...talked with them on the fone to go over my order...and were quick in building the cables and shipping them out..

hope this helps

The external speaker jack is set up for only mono use. I doubt it is a stereo jack as the rings would not line up. I use a CLRspkr with mine and the DSP of the radio and the speaker gives excellent audio.

The external Speaker jack - J4 - is shown on the ORION II schematic as a 3 circuit (stereo) jack with no connection to the ring. If there is, in fact, no connection, either and 2 circuit or 3 circuit plug can be used. There are a set of contacts, in jack 4 to disconnect the internal speaker when an external speaker is plugged into the speaker jack. There is no document number on the schematic, I have, but I downloaded it from the TenTec website. Also on this schematic is the Key jack, DB9 Serial jack, and 2 Din 8 connectors. Lynn Finch, W2MSJ

I have been a member of the group about a month now. Getting as much info on the 565 Orion as I could before buying one.
I just bought one and it should be here in Texas next week.
I asked the ham I bought it from what firmwarw ver. it had and it has 1.3 I think.
My question is, has there been any problems with the latest verison?
Thanks de

Hi Don -
Firmware and software are never perfect; there can always be changes for improvement. Having said that, the latest firmware update for an 565 Orion is absolutely outstanding in my opinion. The "SAF" feature alone is for certain operating conditions, genius (thank you again John Henry).

To me, controlling the Orion's capabilities is best if you understand the block diagram and better yet, a good part of the schematic. I am not saying you have to be that intimate with the innards but deciding what control levels to use are better understood if you kind of do a mind-meld with the hardware.

The neat thing about firmware is you can always go forward AND backward unless there were hardware modifications/requirements to mandate a specific firmware or range of firmware. If you had the new 2nd receiver card for example, that will only work with a certain minimum version/revision of firmware.

Topic: 8499 Message: 8503

I dont have the answer why external alc has not been included. Not being exposed to this challenge I started to browse the internet and found some good descriptions and it became a bit more clear.

Am I correct that alc will ideally prevent the transmitter to exceed a certain level and hence prevent distortion? If so, why would one need to make this alc external? Would it be logical to expect the external amplifier to manage its own transmit output?

Or is it the case that the external amplifier detects it is exceeding its specific max output and hence would want to control the exciter (orion) to reduce its drive into the amplifier? This would mean the amplifier can change the output power of the orion right?

In an ideal world the exciter (orion) would have clean and stable max output towards the amplifier. I guess changing load and frequency makes this a bit more complex to achieve and hence alc could help to automate this a bit better?

Sorry for asking perhaps silly questions but I would appreciate to understand the principles.

Best regards, onno de pa1ap

PA1AP;

You are correct in your understanding that the amplifier reduces the output of the transceiver to a value set by the ALC control at the amp. In this way a solid state amp that only needs, or wants, 35 or so watts to produce its full 1KW output could control the output of the transceiver to this value by the ALC voltage produced by the amp.

Over the years I've had at least 10 or more transceivers and to my knowledge the Orion is the only one without ALC.

I have also owned at least 6 amps over the past 10 years and all of them included ALC even going back to my Kenwood TL-922 which is a 25 year old amp.

I called Ten Tec and inquired if ALC could be added to my O2 and was told, "our products don't need ALC".

So I'm relegated to reducing the power output of my O2 manually.

My complaint may induce Ten Tec to get off the mark and include ALC control in their future transceiver offerings.

Just my 2 cents.

George W2YJ

Subject: [orion565] Re: Orion 565/566 ALC

I dont have the answer why external alc has not been included. Not being exposed to this challenge I started to browse the internet and found some good descriptions and it became a bit more clear.

Am I correct that alc will ideally prevent the transmitter to exceed a certain level and hence prevent distortion? If so, why would one need to make this alc external? Would it be logical to expect the external amplifier to manage its own transmit output?

Or is it the case that the external amplifier detects it is exceeding its specific max output and hence would want to control the exciter (orion) to reduce its drive into the amplifier? This would mean the amplifier can change the output power of the orion right?

In an ideal world the exciter (orion) would have clean and stable max output towards the amplifier. I guess changing load and frequency makes this a bit more complex to achieve and hence alc could help to automate this a bit better?

Sorry for asking perhaps silly questions but I would appreciate to understand the principles.

Best regards, onno de pa1ap

Onno,

You have the theory and application 100% correct. Nothing more to add.

I have a question in the same area: Audio. Why would a "processor" and/or compresor be required? The folks that design the transmitter and audio circuits/parameters are some quite intelligent and qualified engineers and technicians. Perhaps there are many people in this hobby that consider the audio design inadequate.

Simple. By "compressing" the audio waveform, one can raise the average power output by the rig, giving you a better chance of being heard at the other end of a QSO. The trick is to do it without distorting the signal so badly that it flattops and generates spurious transmitter products. Listen to a few of the big contest stations and you'll know what I mean!

Hello Orion Fans,

ALC springs from a time when we had transmitters with tubes and we tuned them manually by adjusting their PI Network output stage.

It was really impossible to precisely adjust the transmitter final stage output to obtain maximum amplifier output without some slight overdrive and associated amplifier distortion. There was no transmitter RF output control, only loading and tuning controls.

The ALC voltage developed by the amp provided the means to achieve a more distortion free output, reducing over driving of the amplifier input. Interestingly, it also provided a form of compression, keeping the average output of the amplifier at a higher level than without ALC. Not all transceivers and transmitters had speech processors and compressors.

Some operators found it an advantage to construct a small variable output low voltage (~9 VDC) supply using a battery, and feed the output of the supply into the transmitter ALC input. This variable voltage permitted them to create an RF output control which they could then use to trim the amplifier drive level after they had tuned the transmitter PI Network.

With modern transceivers with excellent ALC and precise RF output control, and while carefully monitoring the amplifier output, there is little need for ALC feedback these days. I use the O2 with all of my amps and the spectrum analyzer says all is well with correct tuning procedures.

73 and Happy DXing,

Mike
W2AJI

Mike;

Concerning your response that amps of today do not need ALC my PW-1 would be much happier with a transceiver equipped with ALC. It's not so much as overdriving the amp to curtail splatter but to limit the drive on the transceiver to get 1KW out of the PW-1.

Why do all the other manufactures make ALC input available?

I don't think it is an option of a bygone era.

I use my tube amp only as a back-up and it also has provisions for ALC.

I have to make sure my O2 power drive is set to no more than 35 watts which makes my PW-1 very happy.

Oh, by the way, ALC also makes my Ameritron ALS-1300 happy as well.

Hi George,

You wrote:

"I have to make sure my O2 power drive is set to no more than 35 watts which
makes my PW-1 very happy. "

Exactly, you must set your output to 35 watts maximum. That is all that is required.

You make the point very well. Clearly not everyone must understand what you clearly do.

73,

Mike

Voice is unique and hence audio presence / spectrum is unique. The processor or compressor will ensure all frequencies within the passband spectrum will be of equal amplitude. This will generate more output power within the passband spectrum at the expense of audio quality and dynamics. Your power meter will show a higher value and thats seems a desired goal.... ofcourse microphone characteristic influences audio spectrum too.

I guess thats why cw is so nice :-)

Regarding no ALC, there is an additional factor not yet mentioned here. It's my understanding that different rigs supply different ranges of ALC voltage to amps. That voltage range is not standardized from rig MFG to MFG. Some amps allow for this like the AL-80 for one example, some do not.

At the risk of saying something that is not Politically Correct gentlemen, THIS IS NOT BRAIN SURGERY!! You do not need ANY ALC. This is why YOU can adjust the power out control on your radio(To ensure that your amplifier is not being operated outside of the law.) If you detect that you are using more power than the “minimum required to communicate,” you are REQUIRED BY LAW to reduce your power output to the level that represents the minimum required to communicate.
Seems pretty straightforward to me.....
Blessings to you,
Kirby, K7EC

The Icom PW-1 requires ALC connection for protection of the finals. There may be others.

NO Need for ALC with FL-7000 and Orion combination

read page 10 of FL-7000 amp and it clearly states that there is over drive protection despite no ALC action.

it trips off due to drive greater than 80 watts to protect

to quote the manual

"drive level from exciter has exceeded 80watts, despite ALC fed back from FL-7000 to control excitation"

i use an fl-7000 with my orion and just set the power out from the orion to 50 to 65 watts depending on the band and how hard i want to drive the amp...No ALC....no problem...

that way i get good linear amplification and clean signal and no ALC induced distortion

ALC...stands for Another Lazy Control.... ;-))

my 2 cents severely eroded in value by the bank bail out

8521. 565 Orion problem

Yahoo group: orion565 (2009 — 2013)
Date: 2012-08-08 20:53:15 UTC
From: w5kg
Topic: 8521 Message: 8521

I received my Orion 1 yesterday. When booting up the rig I got a warning "Battery Failure". I am guessing the the battery needs replacing. I ordered one from TT today. The firmware is ver 1.373, I think. I looked but forgot the ver. but I know it was ver 1. I have been told by Paul at TT that I would have to do a mod to upgrade to the current ver.3 and one of the members here sent the pdf file I need. I thought while in that deep to do the battery I would do the mod. The paper work looks rather stright foward. Wish me luck.

Don,

My only warning from EXPERIENCE, (I goofed) be sure you have a very nice fine tip temperature controlled soldering iron for mounting the jumper to the printed circuit board.

Good luck and 73,

John

Well I finnished the mod on the logic board. Now waiting on battery from TT. Someone wrote that BATTERY FAILURE was normal. I would not think that would be normal, when does a reset after reboot. Paul at TT did act as though it was normal.
Getting to battery out was harder than the mod was.
Thanks for the info.

You can run v2 or v3 firmware without doing the mod. The sweep will not work though. Some of us never use the sweep anyway.

I'm thinking about getting the full second receiver for the Orion II. My question is once you get this you loose General coverage so you can't receive WWV without having a second rig to copy on. Any thoughts and comments would be appreciated.
Thanks, Ed

Hi Ed,
You do not loose general coverage receive with the rx-366. The only thing that it does not do well is receive the AM broadcast band. I love the new sub receiver....just hate the fact that am broadcast was not supported.

Not sure about the sub-receiver upgrade for the Orion. I have an Eagle, which I understand is the same board upgrade for the sub-receiver. My Eagle receives from MW to 30 MHz, plus the six meter band.

The Eagle on the MW band is good until you go below 1100 KHz, then the sensitivity drops off.

I use it for Ham and SWL. I must say the N4PY software makes the Eagle shine with flexibility.

I do have an Orion II, and for me the sub-receiver (Jupiter receiver) works fine. It could be better, but for what I use it for it works. I do a lot of cw, and some contesting. Time will tell if I do the sub-receiver upgrade.

So, I do not understand why the Eagle motherboard would not work for SWL.

Does anyone in the Dallas area currently run digital modes with the SL USB device and an O-1? Mine will "hear" the waterfall but the TX output is nil. I've read and know all about setting up the SL USB, soundcard, etc.

I've heard there may be an issue with the Orion digital jack in the back of the radio. If possible I'd like to bring my rig and SL USB device and try it to see if it works. If so please email me at my call at arrl dot net.

Something you might want to check;

1-the default value of the aux input gain (menu / ssb) is often to low to work. turn it up
2- same menu the tx audio source needs to be set to aux.
3- check with voltmeter if the din audio in / out provides a 5v dc voltage. if so, please include a capacitor to avoid that voltage to saturate the transformers within the signal link usb device

I have signalink usb connected on my orion 565 and it works fine.

best regards, onno

This may not be your issue, but I will throw it out there as something to try, just in case.

Have you tried connecting directly to the radio from a serial terminal program such as Hyperterminal or PuTTY in Serial Mode?

If you are using a serial to USB adapter some software is not compatible with all of the chip sets out there - - or maybe it is the reverse and all chip sets are not compatible with all software platforms. It doesn't matter which came first, but there is a known compatibility issue.

I found that N1MM Contesting software would not work with a USB to serial converter based on the Prolific chipset. But I could send and receive commands directly to/from the radio using a serial communications program, so I knew the radio's COM port was good.

I bought a USB-COM adapter from Byte Runner and haven't had a problem since.

Good Luck,
Rolf NR0T

Thanks Ed i read that when you posted it last year but it has no effect. You did write a great resource and it is saved on my HD. I bet the radio is fubar. Time to call Paul! My digi interface has never worked but the SL USB works FB with other radios.

8541. 565 with version 3.XX firmware install

Yahoo group: orion565 (2009 — 2013)
Date: 2012-08-26 17:46:07 UTC
From: w5xj2011
Topic: 8541 Message: 8541

I'm about to put the 3.032 software on my O-1 and wanted to know if you have any instructions. I have downloaded the file and found article on flashing firmware and article 74474 on version 3. It is not clear to me however. My used 565 came with V 2.XX on it so i have not had to do an upgrade yet. Pardon my ignorance of this.

Also how is the new firmware playing for you guys that have done the upgrade?

This forum is a great resource and I appreciate all the help you guys have given me.

Many thanks & 73 de Grant / W5XJ in Dallas, Texas

8549. Orion II main af control touchy

Yahoo group: orion565 (2009 — 2013)
Date: 2012-08-28 03:42:32 UTC
From: k7fd
Topic: 8549 Message: 8549

FYI, it seems my main AF volume control is exhibiting strange behavior at times...

It gets 'stuck' sometimes and will not respond to turning the knob back and forth. The bar graph associated with the volume level does not increase or decrease either. To get control back I've noticed a slight tug on the knob will make it work again...or turning the rig off and back on, too.

So I can't tell if it's a mechanical or electrical issue. Anyone else ever have this happen?
99 percent of the time it works like it should...and I can't duplicate it.

73 John K7FD

Same here. In addition, the sub Rex volume does the same thing. If I press on the front panel (like fixing the rit) it starts working again. 73, Rod w7zrc

I had the same problem on an Orion 1 following a software upgrade. Same for both main and sub. Even fiddling the knob/s eventually seemed to fixed it (until next time it happened, which was quite quickly). Had to reinstall the software to fix it permanently.
Have you had the problem for long , or has it occurred since you perhaps recently installed or upgraded your software? Or did the problem just suddenly start all by itself, for no identifiable reason?

My O1 has done this for some time now. A lot of the times I push a button or knob and nothing happens. Most times I have to push whatever button 2 or 3 times to make it function. Whenever I'm in a sub menus and I go to change a value I've actually turned the knobs to lessen the value and the display will show the value to increase before it decreases. Something I've learned to live with

Tom I changed the battery out a few months ago for another reasons (didn't fix it either) but it's aggravating to know that you are turning a "encoder" to turn the value down but the values increases

One thing I have noticed in the last 2 or 3 upgrades is that sometimes the controls are a slight bit slower in responding. I'm wondering if the newer softwares have affected the response time of the controls.but then again it may just be me J

Well misery loves company and it's comforting to know I am not alone,
hi. My new O2 is about 4 months old and I upgraded to the latest
firmware the day it was available. I don't remember having the problem
before upgrading but then again I hadn't had the rig long. I do notice
the problem more in the last 2 weeks more than before however. The only
knob affected on my O2 is the MAIN AF, all others appear to be OK. I'll
reinstall the firmware again and see if that helps...

I probably shouldn't let the cat out of the bag (John Henry is going to kill me) but I'm using the NEW ORION III. I can't even begin to tell you of all the nifty features including the Ten Tec Virtual View (TTVV) ©™ touch screen with icons and the Voice Activated Command Center (VACC) ©™.

I believe my old ORION II had these problems but can't remember for sure. I know that with my ORION III docked to my computer (blue tooth) and my smart phone, Radio has never been this much fun before. I can walk around the house with my wireless headphones / mic on... up to about 150 feet using the TenTec BTB (Blue Tooth Booster) or wake the unit up remotely from my car or while shopping or hiking. I don't have part numbers yet but think the ORION III will be a model #777.

Watch T*T's website for an announcement sometime late fall or early 2013.

Thanks Sam, I wish I was developing something like that now. And for those that think that something like that is coming out, uh, think again. We have our hands full getting several models into and through first production runs, 418 539, etc.
Yes, we are always thinking about what the next rigs should be, but there are several things we still have planned and in progress for the existing rigs, 566, 588, 599, etc. So, whereas Sam had some great ideas, I don't think those will happen even in 2013.

And don't worry Sam, we are still going to nail down the AN on line out issue you had brought up, just need to get time.

Thanks, and 73,
John Henry, KI4JPL
TenTec Engineering

No problem John. Those that know me know that "I DON'T LIE" !! I can't, it's not built in me (anymore). It's a long story I'd be happy to share with anyone, but I just don't lie, period. Not even a little white lie, nope !!

So, if you carefully inspect that email I sent, you will see a little "*" beside my name. If you look at the bottom of the email it clearly (ha) says, and I quote myself here... "* this was a dream of mine that I thought I'd share with everyone".

So you see, I was just checking to see if everyone was awake.

And yes John, it was bad last night with all the pops and clicks, but I will wait patiently for the fix. Good things are worth waiting for.

So in the mean time I'll sit back and play with my ORION III, and all the other dreams I've had lately (glad to see you are reading these threads... no wonder I own a Ten Tec ! Talking directly to you is like having a Bat-phone connected directly to the president... (disclaimer: not comparing you with the asshole in Washington)).

Thanks Sam, I wish I was developing something like that now. And for those that think that something like that is coming out, uh, think again. We have our hands full getting several models into and through first production runs, 418 539, etc.
Yes, we are always thinking about what the next rigs should be, but there are several things we still have planned and in progress for the existing rigs, 566, 588, 599, etc. So, whereas Sam had some great ideas, I don't think those will happen even in 2013.

And don't worry Sam, we are still going to nail down the AN on line out issue you had brought up, just need to get time.

Thanks, and 73,
John Henry, KI4JPL

My Orion II has developed problems in a similar way. My main volume knob has an issue, plus the PBT seems to go off in the wrong directions while turning it in the opposite direction.

So it seems there might be an issue in the new upgrades.

Date: 2012-08-28 18:57:31 UTC
From: w5kg
Topic: 8563 Message: 8563

After I updated to ver. 3.032 I found that the sweep function in the menu and the button on the front does not change the range any longer. I can only turn it on or off. Not a big deal but just wandering if that is the way it is suppose to be now.
Also every thing else seems to be working OK.
The more I use the Orion the better I like it.
Thanks for reading.

Hmmm, that is a bit funny. I hadn't updated the firmware on my Orion II in a long time. I was running 2.044A for a couple years and was starting to get funky responses from a couple of the controls.

I recently updated to the new 3.029 and all the problems went bye-bye! The Orion behaves perfectly now though I've noticed that the range on some of the controls is a little greater. I don't have the new receiver as I rarely use both receivers at the same time.

I like the Orion II.......I'm curious to see how the Orion III is!

8567. Orion I V3.032 failure

Yahoo group: orion565 (2009 — 2013)
Date: 2012-08-29 03:16:17 UTC
From: john_ke5c
Topic: 8567 Message: 8567

My Orion I is older (07C10183) but has a late run logic board due to a failure of the original board. I finally jumped from V2.062a to V3.032 doing all the RAM clears and master resets, but every time I lowered the sidetone level to 10-15, the radio locked up and needed a master reset to come back to life. I did this 3 or 4 times.

I loaded V3.030 and tried to duplicate the general setup as much as I could, but it did not do this, and everything seemed to work.

To confirm, I reloaded V3.032, and before I changed anything from the first boot settings, I selected side tone and lowered it. At 10 the radio locked up.

I reloaded V3.030, and before changing any setting, selected side tone and could vary it from 0 to 100 with no problems. The selective audio filtering function is very interesting!

Hi John.

Looking at your serial number your rig was likely produced in July 2003. My Orion was made in September 2002 (1st production run) and I do NOT have the side tone issue you describe when running 3.032 firmware. I normally run the side tone in the 10 to 15 range.

I have replaced a faulty sweep board and installed the new Sub-RX but all other boards are of 2002 vintage.

8569. Orion II T/R relay noise revisited

Yahoo group: orion565 (2009 — 2013)
Date: 2012-08-29 17:19:54 UTC
From: floydsense
Topic: 8569 Message: 8569

Finally got around to tearing the Orion II down to investigate the relay noise when operating CW. On my Orion, the T/R relay was loud enough to be heard in the next room, and forced me to use headphones anytime I was operating CW. In a minute I'll post a PDF file to the Files section here showing how I resolved the problem. I'd describe my relay now as barely audible. A good portion of the noise was the result of the relay body being in contact with the board, but I think the physical relay design was also easily transferring the reed ticks to the air.

Sorry, but the document exceeds the file size for the group, so you can find it here: www.k8ac.net . Select the "Quieting Orion II T/R Relay" item in the menu to download a 6 MB PDF file.

> Finally got around to tearing the Orion II down to investigate the relay noise when operating CW. On my Orion, the T/R relay was loud enough to be heard in the next room, and forced me to use headphones anytime I was operating CW. In a minute I'll post a PDF file to the Files section here showing how I resolved the problem. I'd describe my relay now as barely audible. A good portion of the noise was the result of the relay body being in contact with the board, but I think the physical relay design was also easily transferring the reed ticks to the air.

Thanks Rick! Your message encouraged me to try again. This time I carefully performed: 1) RAM clear, 2) master clear, 3) V3.032 upload, 4) RAM clear, and 5) master clear. Now sidetone level working from 0 to 100 without crashing. 73--john

Onno, is there a method to modify the data once it is stored? I would like to type in all of the memory info and then restore it to the Orion II rather than finger poke all of them into the Orion front panel. Thanks for the program, I haven't needed it yet but I know the day will come!

The original aim was backup and restore orion settings. You can open the backup file and change its content using text editor but it would not be straightforward. I have a memory generator I have used during the validation process. Perhaps I can share this to provide quick memory generation?

I would need to do some cleanup of the interface but the framework is there. Would you need a read memory prior to memory edit or would it be sufficient to just create your ideal memory content and write it to orion? Securing this memory would be the local copy of the memory write program as well the use of backup/restore orion settings.

Just would like to have confirmed more people are interested since it will take time and effort to build.

Regards, onno
P.s. lots of effort spend to ensure cross version firmware compatibility as well content integrity validation. But I guess thats needed for all backup and restore programs. Hope you do not need restore though ;-)

Onno -

How about a separate stand-alone program for entering ideal memory
content and writing it to Orion?

I don't see a need to complicate Backup and Restore.

From: pa1ap
Topic: 7358 Message: 8579

Going through scenario and trying to figure out comfortable and quick way to create the memory input. We have frequency, mode and location.

Turbo way would be to type frequency, mode and position in the same line. Would that be something to consider as option? Something like 14.250,2,25...

slower way would be combination of frequency entry, radio button mode and counter for location.

Any use taking the memory backup file as input? Program would create a big table with the memory positions and through mouse pointer you could select the fields you would like to change...

brainstorming options.... regards, onno

Hi John
I have Orion 1 vers 2 I also went from "2" firmware to "3" firmware But
I loaded 3025 before loading 3030 and then loaded 3032 and have not had
a problem to my logic I think the new firmware when loaded needs certain
aspects of the previous firmware for the new firmware to work correctly
and even then sometime you get a load that does write correctly to to
the flash ram, that happens don't worry just load it again.

Regards Wayne VK4EU

8583. Headphone audio

A few weeks back someone emailed me a fix for the low headphone audio

If you can could you send it again. The low audio in the headphones is terrible, even with SAF the audio is half of what the speaker is

I have not changed software but I may have too, to much straining to hear

BTW using ver 3.032 and Heil ProSet plus headphones, WITH THE VOLUME ALL THE UP!!!!

John

Going through scenario and trying to figure out comfortable and quick way to create the memory input. We have frequency, mode and location.

Turbo way would be to type frequency, mode and position in the same line. Would that be something to consider as option? Something like 14.250,2,25...

slower way would be combination of frequency entry, radio button mode and counter for location.

Any use taking the memory backup file as input? Program would create a big table with the memory positions and through mouse pointer you could select the fields you would like to change...

brainstorming options.... regards, onno

From: k0rs
Topic: 8586 Message: 8586

Hello. I just picked up a 2007 vintage O2 that has been sitting unused in the box. I upgraded to the latest firmware and that went smoothly. Getting along with the rig well so far and enjoying all the capability. One puzzling thing that, if covered in the manual, has eluded me so far. What does the icon located between the larger numerals in the frequency readout and the "TR" indication in the upper right part of the screen refer to? It is a blue "A," "B, or "C" in a blue box (default color setting). It often changes as I change bands. In photos of the radio that I see on the web it is often absent altogether. Thanks in advance.

Larry, K0RS

Reckon it's the 4 (A, B, C, D) stacked band registers

Ten-Tec told me that later versions of the software and the O-1 do not allow sweep size changes as it is fixed now. I know this contradicts the manual but that is how it is. I have an O-1 myself and i love it. Using 2.064x firmware now but soon plan to upgrade to latest version. I also have the TT Hercules II solid state amp and it is great. Makes the Orion a 550 watt transceiver.

I had to change out the snap hat battery on mine as it was failing and the memory would not hold. It is an easy fix if you ever need it.

The display on mine would also get weird sometime and i found out that all i had to do was exercise the pot on the bottom of the radio that regulates the display brightness. It sat on a shelf for a long time with the previous owner so i guess it got corroded.

The Orion is a magnificent hf radio. Have fun and good DX to you.

I have an early Orion 2003 (vintage) and am still using a beta version program 1.374 or something like that. I have not used the radio much but like it. Can I upgrade just by downloading the new software and will it work on my older Orion WITHOUT ISSUES?

On my Orion (not an O2) there is an A, B, C, or D that shows what band register you are using. The registers allow you to have four different band settings and they are indicated by the letters. The letters change as you repeatedly push the same band button. What you are describing for the O2 sounds like a band register indicator.

Yes, but the sweep won't work at all unless you install the v2 sweep
hardware mod

There have been a number of revisions to the 565 and 566 manuals over the years. It would not be surprising that one manual might have the ABCD info in it while an earlier version would not. You can see the revision history on the TenTec downloads site. It is sort of like looking at something downloaded from an old web page and not realizing that there is an updated version.

Let's face it. We are dealing with radios that have many iterations of adjustments, manuals, and glitches. It is time for everyone to get a grip on the ABCs (and even Ds) of this stuff.

The referenced section of my Orion manual describes the band registers but makes no mention of the A/B/C/D indicators.

By no means criticising the forum members and their contributions provided. The content is great.

But should we look around for a better forum platform providing better support for todays discussions? It would be very benificial if answers provided can be made sticky or marked by voting buttons. Perhaps combined with the possibility to mark discussions with categories such as manual, control, transmit, receive etc.

The recent abcd discussion raised this challenge again. Most members know this has been answered several times already. Perhaps if forum members could perform an easier search this could have been avoided.

I realize this is off topic and I created a poll to collect your opinion. The poll might result in another discussion.

Best regards, onno de pa1ap

8604. New poll for orion565

Yahoo group: orion565 (2009 — 2013)
Date: 2012-09-04 07:24:12 UTC
From: orion565@yahoogroups.com
Topic: 7 Message: 8604

Enter your vote today! A new poll has been created for the
orion565 group:

If you could include more functionality to the yahoo forum platform what would you like to see included?

P.s. this poll is about the yahoo forum functionality and not about the forum members.

o yahoo forum structure is just fine as it is
o being able to vote popular discussion would be great
o being able to assign discussions to a category would be great
o being able to link files, fotos to an discussion would be great
o being able to select a particular view on category, popularity. etc would be great

To vote, please visit the following web page:
http://groups.yahoo.com/group/orion565/surveys?id=13151424

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Hi Onno. A few comments based on my experiences running other Yahoo groups and forums:

1. It's possible to enable the attachment of files/photos to posted messages here on the Yahoo group. The attachments then appear under "Attachments", a new heading under Messages on the left-hand menu.
Those attachments remain until deleted.

2. Common questions can be summarized and placed in a Frequently Asked Questions (FAQ) section which could be a file in the Files section here. That would allow the moderator to simplify and reduce the amount of text so a reader wouldn't have to plow through dozens of replies to find a complete answer.

3. It seems that quite a few folks in all Yahoo groups never visit the website, but rather receive the group activity as message digests or individual emails. Those people will always re-ask a question.

4. With sites that support categories of subjects, I regularly see mis-categorized posts or posting the same question to multiple categories. Unless that's managed closely, it quickly becomes a mess.

5. Better choice of subject wording and/or changing the subject goes a long way to make previous discussions and solutions easier to find. Some of the best information becomes lost in a discussion that wonders far off the original subject.

Anything that would make it easier to find already answered questions is welcomed I think...

That being said, some people seem to be to thin skinned, or easily insulted to be online in a discussion group. I've learned alot by watching what was asked and answered here... The stuff that may seem offensive I just dismiss. I'm not insulted by it. Mom taught me that if we were all alike life would be pretty boring..

Have a great day.

Well, I'd sure like to know if I am the only owner of a 565 that won't run V3.0xx for beans but seems very happy on V.062a. Since my original post, I spoke with TT service and purchased a memory backup battery. The new battery is at 3.6v but the old one was only down to 2.8v. Anyway, I replaced it. The same gremlin shows up as I described below except to clarify the VFO knob, receive and transmit usually, but not always, work. It sure seems like a bad RAM or memory overflow type of problem. I verified the firmware after most of the controls locked up, and a master clear will reset it, so the micro is not in hard never-never land. I'll call TT again tomorrow I guess. Any ideas would be greatly appreciated.

8611. S meter bulb

Yahoo group: orion565 (2009 — 2013)
Date: 2012-09-05 12:56:38 UTC
From: thomasmschaefer
Topic: 8611 Message: 8611

Hi all,

I just joined the group. I am evaluating for my own purchase an Orion II that my club is selling for an estate.

I noticed the s meter bulb flickers in response to the strength of the received signal or it just goes out. If i tap on the s meter, the light will come back on I assume the bulb is bad. I have read through most of the info on the rig but I did not see a service manual. Is there such a thing? I wanted to see how to replace the bulb.

Also, the rig has no extra filters or the antenna tuner. It does have the power supply and the desk mic (707 I think). Does $3100 seem a fair price for that?

Thanks

Tom NY4I

Hi John
Has your 565 had Version 2 hardware mod if it has not that could be
your problem. If your 565 has had the version 2 hardware mod then try
reloading the last v2 firmware that worked well. You can find out if the

V2 hardware mod has been completed by pushing and holding Menu button it will be displayed on screen.

Now reload V 3.025 do not do ram clear or master reset after, then reload V 3.030 again do not ram clear or master reset then load V3.032 again do not ram clear or master reset. After all that just turn off and turn on again. I worked on the idea that you might load all the updates in order without any gaps. That is the method I use and 565 Ver 2 works great and is fully functional. Also some USB to serial adapters give some connection problems.

I hope it works
Cheers Wayne VK4EU

Tom: How old is the rig? You can look at the S/N and post here for info.

I purchased an Orion II with less than 100 hours, and 18 months old for $2750. It came with the three extra filters (1.8, 600, 300), the fan, and the 302R remote encoder.

I've had it now for six months, so my two year old Omni VII is going up for sale.

Good luck on the Orion II.

Thanks for all the responses! TT engineering says it sounds like a bad DRAM chip. V3 is using an address range not required for V2 if I understand which is why V2 works reliably but not V3. They are kindly letting me send the front panel only for a chip replacement. No hard feelings, of course, if that does not work since they would have preferred the whole BIG radio. I'll repost in a few weeks.

For sale Ten-Tec Orion II in very good condition, no scratches or flaws, has not been around tobacco smoke. Has all optional filter slots filled (1.8, 600 & 300 filters). Does not have optional antenna tuner. Comes with original manual, power cord and box. Will be shipped from Ten-Tec after being checked-out and minor repair of the TX audio circuit (mic gain is down). $3000 OBO plus $50 help on shipping/insurance, in CONUS only. Payment by money order or bank cashiers check no Paypal. Please contact me off-list.

8619. Re: [orion565] S meter bulb

Yahoo group: orion565 (2009 — 2013)
Date: 2012-09-05 21:10:39 UTC
From: Luther Phillips
Topic: 8611 Message: 8619

Hi Tom, and welcome to the group.

The Orion & Orion II do not have standard bulb(s) for lighting the S-meter, but use a strip of 5 LED's. You can see them mounted along the bottom edge of the meter if you look down into the meter from above. I'm certainly not sure about it, but they may be an intergal part of the meter assembly itself which means you would have to replace the entire meter if that is the case.

There is a meter currently listed on the popular auction site for $20. It's hard to tell from the picture if the LEDs are built into the meter, but it does show a small connector on the end of some wires. You might check the connector on the rig you are looking at to make sure it is seated properly. Those things can work loose over time.

I've had a few Orions/Orion II's (currently have a II) and have never noticed the S-meter LEDs diming or flickering.

There is no publicly available service manual, but the complete set of schematics is available for download at Ten-Tec's website. They would not show you how to change/repair the LED's, of course. You might call Ten-Tec's service department- I'm sure they could tell you what you need to know.

To go along with Jerry's earlier reply, $3,100 may be a little on the high end for an Orion II with no tuner or extra filters, even with the PS & mic. You can call or email Ten-Tec and get their current trade-in value for the radio to get another data point.

Good luck!

73,
Luther N4UW

Topic: 8624 Message: 8624

I have seen where some were having problems with the Signalink USB transmitting. I hope I am not beating an old horse to death here, but I have the same problem using the TT 712. Receives great and PTT is ok. Keys the Orion but no audio out. Meaning not transmitting. I have tried ajusting computer but I am having no luck.
Great rig the Orion but both manuals are confusing about the menue settings also.
Thanks de
Don, W5KG

I have installed version 2.64 and was wondering if it will work fine if the hardware update has not been done.

Harry - it should work OK with the exception of your band scope which will not operate without the hardware update.

Yes, the band sweep. Sorry, forgot the "official" name for it! If I remember correctly, the firmware will tell you when the radio boots up that the Ver. 2 hardware mod is not detected, and then the sweep function is disabled. It's been a while since I did mine, so I don't remember the exact wording. Either way, the firmware will work otherwise, and depending on which version you are running, it will have the particular features (and maybe, bugs) that that particular release had. You'd have to go back and read the archived forums for those releases to see which had what unless someone has created a list of that information. Hope this helps.

And, thank you for your service. I left the USAF as a "buck sergeant" after four years during the Vietnam era.

On your Sony Vaio, plug in the USB/Serial cable and go to Control Panel - Device Manager. Expand the Ports section and look for a "USB Serial Port" listed as "COMx". If you see that, then just use the COMx value in the Orion Update program as your serial port.

73/GL,

Theres no comx port or otion in the controlpanel/device mngr...
Mine. Is windows 7 in an old sony vaio.

Is this ok ?

No. In the Windows 7 Device Manager, you need to see the USB Serial Port
listed under "Ports"

Mine is the home edition, there is any option listed as ports, should I upgrade ?
Is there this upgrade for mac ?
Rgds

Do you see "Universal Serial Bus controllers" listed and an entry under it
for "USB Serial Converter"?

Your usb serial cable isn't recognized by your pc. Try rebooting your pc.
Try finding the proper Windows 7 driver for your cable. If that doesn't
work, buy a new one that uses FTDI driver/chipset.

Barry, my Orion came with two additional cables, one is for aux I/o and has a sort of outputs including one db/serial and another is a band control. Are them suitable for upgrading, may I send you a pic ?
Regards

You need an RS232 serial cable (DB9 connector). It doesn't sound like you
even have your Orion interfaced to your computer.

8646. First HF Radio Purchase.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-09-18 23:21:04 UTC
From: Paul
Topic: 8646 Message: 8646

Hello to the group,

I have been procrastinating and saving at the same time for quite a while, since the original Orion came out. I finally have the funds available to purchase an Orion II, fully optioned.

1. Should I go for the new secondary radio option or stay with the standard configuration? I can see myself listening to international short wave stations even though they are disappearing. Having said that a inexpensive SW receiver could do the same job.

2. My use will be local 80 metre nets, some DX and digital. Is the Orion the rig for me or should I be looking closer to an Eagle or something similar? I am drawn to the use of the 712 usb interface as I would like to make going digital as easy as possible. I am also drawn to the LCD display.

Please feel free to add any comments you may wish too.

Kind regards,

Paul VK3TPM.

Hi Paul

I have a fully optioned Orion II with the original sub receiver using the 2.044 firmware. Like yourself I use it for everything from ragchew qso's to DXing. I'm totally satisfied with the way mine works, including the subreceiver.. That being said I have a friend who has the RX366 receiver installed, and he's told me it outperforms the original. From what I know tho, the newer sub receiver only has attenuated sensitivity in the AM broadcast area of it, which would be from 530 to 1750 khz.

Depending on what you've currently been using for a rig this radio will be a bit of a departure from any analog rig that you've used. What I mean by that is with all the AGC possibilities It can be overwhelming at first.. However, what I and alot of people have done was to pick four different settings for the fast, med, slow, and custom AGC settings and they pretty much cover most of the operating conditions that we work in. And the adaptive nature in the software filtering takes some getting used to because when you make an adjustment there's not an immediate reaction like an analog radio has. If you listen to the receiver the software works on the signal and makes adjustments.

I think you'll be very pleased with the Orion II, and with the 30 complete money back guarantee you're only out the shipping charges should you decide it's not for you. For any reason.. Now that's hard to beat.

Whoops... I meant to say 30 day money back guarantee..

Also, this radio has the easiest menu to navigate of any radio in it's class.. Not to mention the great specs..

Hi Paul,.
I’m Kirby, k7ec, and have 2 Loaded Orion 2s, one with the rx366 and one with the standard subreceiver. I also have a loaded Eagle. I like to listen to am radio with the sub receiver.
The radio that you should consider getting should depend on what you intend to do with it. If you are a contester, by all means get the loaded Orion 2 with the rx-366 sub receiver with 3 filters for the modes you intend to use. If you like to listen to am broadcast on the subreceiver, get the Orion 2 with the standard subreceiver, as the one with the rx366 will not receive am broadcast and the Eagle likewise does not receive any am broadcast worth listening to without doing a mod to the radio that can mess up the higher HF reception should you have a strong am broadcast station on the wrong frequency in your local area. If you do not care about listening to any am broadcast then consider getting the Eagle if you do not want the spectrum scope on the Orion 2 or any of the other features of the Orion 2(like the new SAF feature that was added in the new version 3 firmware.....it is AMAZING how it pulls the signals out of the noise!!) I really like my Eagle, but it is not on the overall level of the Orion 2s in terms of features and base station useability. The Eagle will work fine as a mobile or base station radio, but it is not as fancy and easy to use as the Orion 2. The Eagle is a great radio, but most of the “nice to have” features of the Orion 2 have been automated or not totally included in the Eagle. I would use the Eagle as a backup radio to use in the cabin, trailer, or car unless it was the only radio I had, in which case it would work fine as a main station. So it is up to you, but you must know that the 30 day approval period will allow you to try the radio to make sure that it is the on you really want. I would try the Orion 2 first, because I really believe that is the one you will like the best. It has about 35 years of radio development by a number of business and radio geniuses standing behind it. Literally, 100s of hams have contributed ideas and time to its development. It is an excellent machine and this is verified by the fact hat almost every radio produced by any and al other radio companies have used features and similar architecture in all of the various other top line radios. Even the IC7800 and the FT9000 which use different architectures and cost twice as much (and are really nice radios) do not in many areas rise to the technical excellence of the Orion 2. The K3 I also a great radio, but again it uses architecture similar to Orion 2. So many choices, so little time!! Have fun and remember that ham radio is a wonderful HOBBY!
73 es enjoy your new radio, YOU choose,
Kirby, K7EC

From: Edward A. Feustel
Topic: 8646 Message: 8650

Paul,
I have an Orion 1 with the standard receiver and all filters. I use the small add on that Ten Tec offers to isolate the Audio sent to the sound card. FLDIGI works well in this way with the ORION. The general coverage receiver is much better than the usual SW receiver because of the DSP and the ability to tune to ten cycles and do LCW or UCW as well as FM on 10M. The second receiver is one reason I prefer an Orion to an eagle.

I participate in NH ARES voice/digital on 80 meters. we have a Voice state net at the top of the band and digital on the lower. The Orion makes possible listening to both at the same time. Of course you can't receive digital when transmitting voice or vice versa.

While I have considered getting an Orion 2, I don't really need the color displays or the faster "functions" processing. I am currently running 3.032 and am satisfied with it. And getting a good Ten Tec checked Orion 1 with all mods saves $$ for an amplifier, antenna tuner, or SDR.

73,
Ed, N5EI

8651. trimmers Orion

Hello. Can someone give me the correspondence of the various trimmer on the plates of the Orion II. Example: R20 PWR is the display and power output on the display.
Especially the two small bruises on block amp output and white only later still on the board puissance.Derrière side fins. I'm also looking SWEEP setting is too low.
thank you. Jacques.

Hi Paul,

Much depends on your preferences. I know I have the Orion II here with the original receiver. I didn't upgrade the second receiver as I use it primarily for amateur communications. I have a couple of other separate receivers for short-wave listening. I'm very happy with my Orion II and firmware version 3.029 for casual SSB, CW, PSK31 and AM use on all HF bands. Yes, I do ocassionally use AM! ;=)

Hello Paul,

My feeling is that the orion design is around high performance ham band operations with less focus towards broadcast stations outside ham bands. On ham bands and associated modulation techniques the orion is very good in my humble opinion.

On the lcd and associated control; the orion does not shine in real time spectrum display. It works but not even close to what todays sdr solutions provide. The lcd is there to provide you with operating information and does this in effective way.

I like the ease of operations (big knobs, easy menu) and the new firmware does the job well. The orion provides flexibility in several areas but this also means you can apply wrong settings. Expect a learning curve since the orion will not stop you from using experimental settings.

best regards, onno

From: w7zb
Topic: 8657 Message: 8657

My 565 has developed a problem I have never seen before. When tuning the VFOA dial slowly, usually everything tunes as normal. When moving the knob not slowly, it seems to lock on a frequency and not move. Happens on all bands, and when step is 10 or 100. Then it stops happening and tunes normally. Tried rebooting, same. Haven't tried any kind of reset. You guys seen this before? Tried a search....Thanks, Mark, W7ZB

Hi Mark,

Weird problem! From what you describe it seems some sort of vfo lockout.

Couple of questions if I may ask;

1- it only happens when step size is 10 or 100hz?
2- do you use X step size to switch from 10 to 100? Or is is clean 10 to 100?
3- you state the problem goes away as well... under which condition?
4- lock up means... frequency display freezes? Nothing works?
5- when you spin the vfo is the lockup the last active frequency?
6- does the receiver / transmitter still work during lockup?
7- using remote control software of any kind? If so what program? When nothing connected (read no serial cable) still same happening?
8- is the problem always there (at choice and depending vfo spin speed)?

Best regards, onno

Sounds like a bad encoder. If it's possible, I'd want to try flipping the cables going to the two tuning encoders and see if the problem stays with VFOA or switches to VFOB.

It could also be oxidation in the VFOA encoder connection and a little
DeOxit would help if it reappears.

Mine did that and I changed the battery out now all is ok.
You can get them from TT for about $10+ shipping or you can also get them from Mouser about half that. Do a surch hr and you can get the number.

From: force2ak
Topic: 8672 Message: 8672

Hello, had a problem with no transmit the radio was doing funny things like the sweep function was a patten all thru the scale it didn't look like a signal. So I did a master reset and the ram clear reset it did not help the same problem no transmit, So I just turned the Orion off. The next day I tryed it again and the Orion was woking like it should like it never had a problem. not sure how it fixed itself !
Just wondering if maybe the battery is getting weak, any information
would be appreciated, Also I did a few master reset's and ram clears
with no results of fixing the problem.

Thanks - Alan

I suggest to report back when it happens again. You might have observed a crash due to static discharge or something like that. I have not, seen this happening before except when there was a static discharge... when that happens everything could happen.... regards, onno

8676. Centurion 422

Yahoo group: orion565 (2009 — 2013)
Date: 2012-09-27 19:17:52 UTC
From: ki4ps
Topic: 8676 Message: 8676

Having an issue with my Centurion. Amp turns on and lights up. When turned on, but not keyed up, the Ig (grid current) shows about 260 ma. It should read zero. If you select the Ep position it does not show the 3100 volts.

The amp puts out about 1300 watts, and seems to work fine. The meter does not show any FWD indication, however, the Peak Power LED's work. In REF the meter does show indication.

Not sure if it's the QSK board or not. TenTec was no help. They just told me to send it in.

The following orion565 poll is now closed. Here are the
final results:

POLL QUESTION: If you could include more functionality to the yahoo forum platform what would you like to see included?

P.s. this poll is about the yahoo forum functionality and not about the forum members.

CHOICES AND RESULTS
- being able to assign discussions to a category would be great, 5 votes, 18.52%
- being able to link files, fotos to an discussion would be great, 8 votes, 29.63%
- being able to select a particular view on category, popularity. etc would be great, 4 votes, 14.81%
- yahoo forum structure is just fine as it is, 8 votes, 29.63%
- being able to vote popular discussion would be great, 2 votes, 7.41%

Hello Tim,

You seem to have used the different agc modes to rotate through certain settings to arrive at quick setting. There is a spreadsheet in the file section which captures settings other hams have used. Hope this provides information to help you moving forward.

Moving agc activation point above undesired signal would in most cases be sufficient to arrive at good quality audio. Depending on dynamic range and mode of operation the hang time and decay time might smooth the audio a bit more during local rounds. Agc would become a bit more sticky / lazy doing so. Not good if you need to copy quick cw sequences with varying signal strengths.

I became more relaxed about agc and just look at undesired signal level and turn down rf gain until s meter exceeds undesired level. Takes a few seconds. Agc mode slow for local chat, agc medium for significant signal variation and sometimes agc fast. Small adjustment within agc slow with hang time (100mS) to soften the normalization.

Perhaps its worth to backup your settings to ensure you can restore them after a reset event.

Best regards, onno

Agree with Onno. Forget about AGC obsession, it's all nonsense - turn UP
AF Gain, turn DOWN RF Gain and relax/enjoy.

What version of Windows do you have on the computers you are using? I had Windows XP on mine and found it took a long time with my Orion II as well as my Omni VII. I upgraded one of the computers to Windows 7 and now they both fly when I update though I haven't had to update anything in a few months.

Would be good to know the windows version indeed. Besides windows version can you share how the orion is connected? Using usb based serial port

Oldest OS I have used regulary is windows xp with usb srrial cable abd the update takes a couple of minutes.

The firmware update routine will send a string to the orion, wait for confirmation, checks crc value and then goes to next segment. In case the serial cable does not have hardware handshake wires connected this might cause issues and hence the sequence might break.

If you like to test you could install the serial tester program to see if the serial cable works as it should be. After connection test you need to start the memory sequence test which 9 out of 10 will trigger cts.. if you see cts changing the wires are fine. If not you might have incomplete wiring.

Best regardd, onno

Hi and thank for the reply.

I have try on 3 different computer..all running Windows XP. 2 of the computer have build in serial interface and the other one was with a usb to serial converter. At this time, i have try 2 different serial cable, and they are commercial cable.

Where can i get the serial tester?

Guillaume

Ok, i just found and install the program.

All test pass, 10x test also on ant toggle and version request... The real time cts stay green all the time in the windows..

I use the usb cable direct on the back of the orion...usb cable to orion ..no intercable

After connection test you need to start the memory sequence test which 9 out of 10 will trigger cts.. if you see cts changing the wires are fine. If not you might have incomplete wiring.

Guillaume,

I had trouble once loading an upgrade. Being somewhat of a geek, I did what I would tell people with trouble.

1. I rebooted my computer with a cold reboot. (shut down, wait a bit, and then restart.)

2. I did a master reset to the rig.

After doing both of these, everything work great. I don't know what the problem was, but it just worked!

I would also check the driver for your USB to serial cable to see if there are updates.

Good luck and 73,

John

Hi and thank for the reply.

I have try on 3 different computer..all running Windows XP. 2 of the computer have build in serial interface and the other one was with a usb to serial converter. At this time, i have try 2 different serial cable, and they are commercial cable.

Where can i get the serial tester?

Guillaume

Hi John,

Look like i will never get this radio on V3 :-(

Just tested it with my wife Windows 7 laptop and usb cable.. Something strange happen, on this computer i have the VERIFY icon working..the 3 other don't.. When i load the update file, program do nothing....

RAM board damaged? ...

No more idea..

Guillaume,

If you are running Windows 7, Right click on the Orion Update program icon in the Start menu and select "Run as Administrator." UAC settings may be the problem.

8691. Bit The Bullet

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-12 06:22:24 UTC
From: Paul
Topic: 8691 Message: 8691

Hello to the group.

I finally bit the bullet. Ordered a new 566 with the super sub-receiver, fully kitted out, with lots of accessories. It arrived yesterday, which has found me sizing up crimp lugs for the power cables to connect to my power supply. Unit has not been powered up as yet. Hopefully this will be accomplished when I come home from work tomorrow, I will then see its glorious display.

Thank you to all who replied to my emails, on and offline. I am led to believe that this Orion is the 25th in Australia. A bit of a gamble into the unknown, though I am looking forward to many happy years behind its wheels.

Now for an antenna and some QSL cards.

Kind regards,

Paul.

I went for broke. I bought a Dell XPS, with the fastest processor I could get, max memory etc. I put a 2 Serial port/1 parallel port PCIe card in the computer I bought from a reliable supplier on eBay, and whatever I attach to that computer, flies.

I also put 2 Serial/USB adapters to run my RX-350 and RX-340 with the N4PY software. They work great too! I run the DRM software with the 2 receivers and it works fine too. I've yet to see any conflicts or have any software not function properly. I've had the computer now for about 6 months without issue.

8698. Automatic Antenna Tuner

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-19 13:55:59 UTC
From: Marty
Topic: 8698 Message: 8698

I bought my 566 new in March of this year and love the rig greatly. The antenna tuner has always seemed "weird" and not acted in a way that I was used to as many other automatic antenna tuners I've used. With my tried and true doublet (Balun Designs 4:1 connected to ANT1) its worked sometimes, sometime not.

What I mean by "work" is that sometimes it tunes the antenna fine. Sometimes it doesn't tune the antenna at all. The issue is not a matter of what problems you might expect with an an automatic antenna tuner like not having enough impedance range to match the antenna. Rather, sometimes it just acts like its disabled when it is enabled.

After enabling the antenna tuner, I press "tune", rig goes into transmit with 20W out, I hear the side tone, displays shows 4.4:1 SWR. It just stays in this state, nothing changes, hear no relay action internally, just continues to transmit a steady tone with 4.4:1 displayed. Isn't it supposed to seek a minimum SWR and then switch back to receive?

My Icom rig had no problem tuning this antenna, and its my understanding the Ten Tec AT has a wider impedance range? Its really a matter of the AT acts disabled all the time. Talked to TT about this, after doing a master reset with no joy, they say I have a ground problem. I'm skeptical.

Its to the point where it used to tune sometimes but now it never tries to tune regardless of whether the AT is enabled or disabled.

I've been using my Old Palstar manual external tuner and it tunes nicely, but with SS coming up, I'd like the auto AT to work like it should.

Any ideas? 73 Marty / W4MY

Has it done this right from the start, or is this a new symptom. I don't know of any reason that starting the tuning command shouldn't start the tuning relay routine. On my Orion (1), it works every time. You might call the mother ship and see what they have to say.

Hi Marty,

Just a wild thought; do you use any remote control program with your rig?

There seem to be cases where the tuner is disabled through remote control and the actual menu settings on the orion claim opposite.

Easy to check; If you go to orion TX menu and disable / enable the tuner you should hear a click as far as I remember. The menu setting toggles the bypass relais when on / off.

Could you let us know how it goes?

Best regards, Onno

Onno: I will try listening for the switching relay as you describe when I get home next week (I am out of town until Monday). I don't remember hearing anything click when switching from disable to enable though.

I am not using any remote computer control at this time. I do have the comm connected to N1MM and that is passive.

I have talked to TT and they told me that if a master reset doesn't fix it (didn't) then the only other possibility is a ground problem.

I'd give that some credibility If the AT we're seeking a match and was unable to find one. That's not the problem here. It's acting disabled when in fact it is enabled. Its worked intermittently from the beginning, now it's stopped functioning all together. When I last talked to Paul at TT (when it was intermittent) I felt brushed off.

If I enable the tuner through menu, click on tune the sequence will start. When I go back to tx menu and disable the tuner I hear the click of bypass relais. If I just enable/disable through menu I dont hear click for whatever reason.

Regarding n1mm I do not know how this can operate in passive mode. In order to update logging, the program needs to query the orion. Perhaps another module inserts a tuner disable disable by mistake? I would recommend to disconnect the serial cable and test the tuner without serial control connected.

Another thought could be that the tuner control wire is not connected firmly enough. In am not sure how this wire is attached within 566. If the wire is not making contact the tuner wont activate.

Best regards, onno

8703. S meter readings

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-19 20:13:48 UTC
From: George
Topic: 8703 Message: 8703

Anyone check the S meter reading using a 50 micro volt input? At this level
my S meter, with pre amps off, should read S9.
My Orion2 reads S5??? I'm assuming that the preamp should be off.
With the preamp on the O2 S meter reads S8.
I'm using a Elecraft XG3 as a source.
Now I would suspect the Elecraft at fault but when I did the same test on my
Icom IC-7600 the
S meter read S9.
Anyone try the same test and what did your O2
S meter read with 50uv in?
Thanks

George W2YJ

On my 565, when the tuner is "disabled" via the menu, "enabling" it again (via the menu) does not actually put the tuner back into the circuit. What it does is "enables" the TUNE button which will, when pushed, put the tuner back in the circuit as well as initiate another tuning sequence.

The s meter seems less than accurate on the orion. Couple of items which influence s meter reading besides the pre amp. Agc mode and sub receiver on same antenna will also influence s meter reading. There is work in progress regarding the s meter calibration. Best regards, onno

Onno and all:

Thank you for your suggestions. I guess n1mm being "passive" was the wrong choice of words. It must be active in order to communicate and I understand this. I meant that n1mm makes no attempt to control settings beyond freq, mode, etc. Just trying to be complete.

Moot anyway, when I was messing with this before the computer was off.

I fear I have a hard malfunction and will have to determine that for myself and somehow convince TT to send me a new AT board.

Thanks again.

8708. RE: [orion565] Re: S meter readings

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-20 00:58:37 UTC
From: Martin Sole
Topic: 8703 Message: 8708

Mine reads about S8.5, preamp off, default AGC, sub on same antenna port, S9 with the sub disconnected.

There are 2 internal adjustments that affect S meter reading it seems, one of which also affects the power meter reading and also what appears to be some means to access what the software does with the S meter as well.

If you're not the first owner and know things haven't been tweaked, well they could have been I guess.

What's the ' Work in progress' Onno?

Hi Marty,

Understood on the passive n1mm :-)

I just walked up to radio and connected dummy load to ant1. Then enabled internal tuner and hit the tune button. It will run a sequence for couple of seconds. Press tune again and it will repeat sequence. I did this 10 times and the sequence will just repeat. After those sequences I went to tx menu and when changing tunernto disable I do hear a relais click.

I am using 565 so my situation might be different than 566. However the sequence with dummy load might provide you evidence if the tuner works consistently. If it sometimes tunes and sometimes not despite the dummy load I would raise that to tentec service as a malfunction of the tuner.

Best regards, onno

From: George
Topic: 8703 Message: 8712

I guess I have some re-adjusting to do to get my S meter back to S9 for 50uv.

I'll have to look at the schematic to see what's what.

Thanks for the replies.

To: orion565@yahoogroups.com
Subject: RE: [orion565] Re: S meter readings

Mine reads about S8.5, preamp off, default AGC, sub on same antenna port, S9 with the sub disconnected.

There are 2 internal adjustments that affect S meter reading it seems, one of which also affects the power meter reading and also what appears to be some means to access what the software does with the S meter as well.

If you're not the first owner and know things haven't been tweaked, well they could have been I guess.

What's the ' Work in progress' Onno?

I ran into a snag when trying to download the 566 schematics.

When I tried to download the schematics I get a message “file could not be downloaded”??? I don’t know what that is all about.

Can anyone attach the schematic file for the 566 Orion2 and send it to me?

Thanks.

Thanks to all that sent me the O2 schematics. I was sent a file containing all the prints.
Did anyone attempt to calibrate the S meter and what steps were taken.
I'm not sending the O2 in for just a S meter calibration, hi.
Thanks.

On I:

I wanted to follow up with you on trying my dummy load on ANT1 to see if the AT will operate properly. (No external PC or software connected)

With a perfect 50 ohm dummy load on ANT1 and ANT1 selected, with internal tuner "disabled", pressing the Tune button switches the rig to transmit, side tone comes on, SWR display reads "SWR1.0:1". Rig remains in this state indefinitely until I press Tune button again, where it returns to receive.

With a perfect 50 ohm dummy load on ANT1 and ANT1 selected, with internal tuner "enabled", pressing the Tune button switches the rig to transmit, side tone comes on, SWR display reads "SWR1.0:1". Rig remains in this state indefinitely until I press Tune button again, where it returns to receive.

I assume there should be a difference in how it acts with the tuner "enabled"?

Thanks for your help.

From: pa1ap
Topic: 8698 Message: 8717

Hello Marty,

Thats weird.

I would expect the tuner to engage and tune. On my 565 with original tuner it will start the tune sequence regardless of swr value.

To me it sounds the control wire is disconnected and hence the orion does not know the tuner is there. And if the contact is poor it might see it once in a while.

Couple of thoughts here:
1- the 566 tuner might operate different than 565. But you can ask tt service to confirm
2- with tuner enabled I would expect click/clack sound while tuner looks for match.
3- once match is found tuner sequence will stop automatically
4- Ask tt service for advise on orion and tuner installation. Either control wires is loose or tuner is broken.

What you describe is an orion without internal tuner. Without tuner the tune button will transmit 20 or 25 Watt carrier until pressed again.

Best regards, Onno

Hi Onno:

Yes, my expectation of the AT is the same as you. And since March when I bought the 566 new it acted normally as it should, sometimes tuning, sometimes not. But now it acts like I described earlier all the time.

I sent an email to TT service so we'll see what they say. Thanks!

73 Marty / W4MY

OK Onno, Here's an update

TT replied. Had me perform memory reset and master reset. Said I should try again with an antenna with some
SWR. I did as they asked (again) No symptom change. I will see what they say tomorrow.

Marty / W4MY

8720. Re: Automatic Antenna Tuner

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-24 07:23:13 UTC
From: pa1ap
Topic: 8698 Message: 8720

Perhaps there is someone on the forum with 566 and tuner who can quickly check behavior when connecting to dummy load? As far as I know the tuner has no memory nor knowledge on frequency. This means it must tune each time you press the tune button...

Any 566 owner who can assist?

Regards, onno

Orion II with AT here. When connected to a dummy load and hitting the TUNE button, I can hear the relays cycling very fast and see the SWR 1.0:1 message display momentarily. Then the "tuned" text appears above where the SWR was being displayed. The O2 returns to receive immediately. I tried various other mismatched antennas for the frequency the O2 was tuned to and a successful tune operation took no longer than 2 seconds, with relays changing quickly and the O2 returning to receive mode immediately. I then tried a worst case scenario where the feedline was shorted to ground about 200 feet from the transceiver. In that case, a tuning solution was found in about 6 seconds.

Hello Floyd!

thanks very much for confirmation. Much appreciated. Just to make sure: if you connect dummy load, engage tuner you will hear click/clack sequence. Andif you repeat this without changing dummy load, the tuner engages and click / clack happens again?

thanks and best regards, onno

Floyd and Onno:

Thank you for that confirmation. I have witnessed this action of my automatic AT in the past, as you describe Floyd, but not reliably. It would do it sometimes, sometimes it would not. But it seems to be a hard failure now. My past conversations with TT about it in the past months never got past them telling me to do a memory clear and master reset.

I have most all my settings memorized in my head for doing so many master resets over these last 8 months. I'd like to get to the point where I can quit doing master resets all the time so I can start tweaking the radio the way I like it with the knowledge that if I find something I like it will stay! HI!

We'll see what TT has to say about this latest round, I'm waiting on their reply now after I reported memory clear and master reset did not solve the problem.

Thanks, Marty / W4MY

8724. Audio problem when starting Orion

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-24 19:01:55 UTC
From: hglent
Topic: 8724 Message: 8724

Greetings fellow Orion users,
I have developed a problem with my Orion v3.032 when first turning it on in the morning.

I turn the 963 Power Supply on, and a few seconds later I press the Power Button on the Orion. All appears normal as the Orion goes through the initialization process. Everything comes on and appears to be operating normally. Band sweep shows stations, "S" Meter has appropriate indications. The problem is, there is no audio coming from the speakers or headphones. I switch the power off with the switch on the Orion, and then back on. Everything comes on after the initialization and works perfectly all day. If I shut down both the Orion and the power supply and then return later in the day everything functions perfectly.

I haven't uncovered the rig and dove into inspections and cleaning contacts yet. I am presenting this to all the folks here looking for ideas and clues. I appreciate the expertise and help I get from this reflector.

Yes. The subsequent tune cycles are faster than the first, but it happens as I described every time I hit tune.

Floyd

I leave the power supply on all the time and switch off the Orion II at the radio. No problems. Do you have the situation when you do that?

Interesting sequence of events happening Paul. Is this a 565 or 566?

If the cpu battery module is broken it would not get passed the boot sequence. if the battery is low anything weird could happen and this might be one of the effects. Still strange that it is audio only and apparently very predictable in behavior too.

Could you reproduce the issue and connect a headphone to the orion to see if audio comes through this connection? Perhaps the audio amplifier environment has an issue? And if you switch to cw and key the transmitter, do you hear the sidetone?

You mention 3032 firmware. I assume you performed master reset and such like? Do you see the same issue when downgrading to V2 firmware? Can you confirm the issue is firmware independent?

Best regards, Onno

From: w4my@yahoo.com
Topic: 8698 Message: 8728

Onno et all:

Thanks for help investigating this. Last email from Paul at TT tells me my 566 needs to be returned for warrantee repair.

My backup rig is an Eagle. I will wait until after CQWW-SSB and SS-CW and use my manual AT. I'll use the Eagle for SS-SSB.

Thanks again!

73 Marty / W4MY

With my tried and true doublet (Balun Designs 4:1 connected to ANT1) its worked sometimes, sometime not.
> > > > > > > > > >
> > > > > > > > > > What I mean by "work" is that sometimes it tunes the antenna fine. Sometimes it doesn't tune the antenna at all. The issue is not a matter of what problems you might expect with an an automatic antenna tuner like not having enough impedance range to match the antenna. Rather, sometimes it just acts like its disabled when it is enabled.
> > > > > > > > > >
> > > > > > > > > > After enabling the antenna tuner, I press "tune", rig goes into transmit with 20W out, I hear the side tone, displays shows 4.4:1 SWR. It just stays in this state, nothing changes, hear no relay action internally, just continues to transmit a steady tone with 4.4:1 displayed. Isn't it supposed to seek a SWR and then switch back to receive?
> > > > > > > > > >
> > > > > > > > > > My Icom rig had no problem tuning this antenna, and its my understanding the Ten Tec AT has a wider impedance range? Its really a matter of the AT acts disabled all the time. Talked to TT about this, after doing a master reset with no joy, they say I have a ground problem. I'm skeptical.
> > > > > > > > > >
> > > > > > > > > > Its to the point where it used to tune sometimes but now it never tries to tune regardless of whether the AT is enabled or disabled.

From: Paul K.
Topic: 8724 Message: 8729

Onion,
All excellent points. The rig is a 565 Orion 1. I will start down through the list everyone has suggested. It will probably take a few days since this only occurs at first start up for the day. Yes, I've done all the appropriate resets, and the battery was replaced a few months ago.

I haven't touched the setup yet today, so I'll keep the list posted on progress. I've been doing this stuff for more than -- years, but haven't run into one like this.

Thanks again folks. I'll trudge on and keep the list in the loop.

I had a similar problem. Key is the fact that after the second power cycle everything worked OK for the rest of the day. My problem was cured by replacing the power distribution board, A4 or A7, I don't remember the board ID, but it is the board with the commonly failing capacitors. You can get a new board from TT for about $50 or replace the caps yourself. If you have your rig apart touch the caps carefully. If they are bulging at the top, or running warm, it is time for them to go according to TT service.

You are absolutely right Russell! The distribution board is known for weird power issues. Sometimes it shows through the lcd screen and sometimes other effects happen. I would indeed check this board first. Regards, Onno

8732. Orion 565 S-meter adjustment

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-26 21:31:13 UTC
From: Rick W
Topic: 8732 Message: 8732

The Orion (565) has a built in algorithm to adjust for difference between the various types of S-meters used during production.

I have posted a description of this procedure on my website.

Please note that this procedure applies to the Orion (565) only.

73,
Rick

This adjustment process only works with the Orion 565, not the Orion II 566.

The procedure is also posted at
http://www.tentecwiki.org/doku.php?id=565 - scrolldown to
"Mods/Adjustments/Repairs"

8734. Firmware download problem

Yahoo group: orion565 (2009 — 2013)
Date: 2012-10-29 15:47:44 UTC
From: alan corin
Topic: 8734 Message: 8734

I recently purchased a used 565 with older firmware.When I received the radio it seemed to work fine.I then try to download latest firmware and the radio wouldn’t boot up after that.I sent it to ten tec and they said it probably messed up the dragonball .I would need a new logic board .This is not the first time ten tec firmware messed up a radio. I had previously had to send a Jupiter in because the download seemed to destroy the pld.There is nothing wrong with my rs 232 connection as I run a Pegasus off it for years.I also downloaded Kenwood firmware no problem. Any thoughts on whats going on.Thanks Alan WA2AC

When you power on the orion 565 what do you see happening? Can you describe exact sequence of events? Clicking sound, Led's blinking, lcd backlight, boot message, anything? Also when you hold and press user2 button prior to power on what do you see?

The firmware actually get installed on top of a bootloader. Its very difficult to destroy bootloader. Couple of things which could be broken: dc power board, backup memory block (includes clock to boot)....

can you describe please?

Best regards, onno

8738. AM BC reception optimalisation on the ORION ?

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-05 08:00:52 UTC
From: Mark
Topic: 8738 Message: 8738

AM broadcast reception (522-1700KHz) plays an important part in my daily fun on the Lowbands.
Both being able to find and detect foreign/distant BC stations during the dark hours, as well as purely enjoying the mellow sound quality of local stations during daylight.

The ORION's 2nd RX, being general coverage, is able to provide a very nice sound.

However I have 2 wishes here:

1) Raise the sensitivity of the 2nd RX on AM BC for daytime reception; it is way behind any other receiver (TS570/850,Perseus). Do I need to change the input bpf(BC bandreject?) or simply add an outboard preamp?

2)I much prefer an analog s-meter; can the ORION's main RX low boundary on 160m (1790KHz?) be extended to say 500KHz? Off course this would need a change in the input bpf too. I take it this is sw-wise not possible but need to ask.

I recognize the ORION was not intended for this kind of use, but the lush mellow sound on AM BC makes it my current favorite. For weak signal DX on AM BC I use a Perseus SDR, but "miss the big Dial" for just tuning the band. And my R-4C does not go below 1500Kc.
I am open to alternative suggestions.

8739. Sub Receiver for MW

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-05 18:07:01 UTC
From: ki4ps
Topic: 8739 Message: 8739

Mark: The Orion's second receiver is okay on MW, but I will tell you my Palstar R30A will run circles around the sub receiver especially during the daylight hours.

Lately I've been using a ground antenna. That's a 100 foot of coax laying against the house foundation. The end is shorted and it works great. That way I can still have my ham antennas for my ham stuff.

Huh! I never tried my 516 as a BC band receiver but it doesn't work bad. I just gave it a try. I usually use my RX-340 for BC work as well as listening to VLF AM BC from Europe and northern Africa after dark.

If Jerry could give me more info on your ground antenna! What type of coax do you use? Will RG-6/U work? With it shorted at the end, I'd think it would not be that great.

RG-6/U will work just fine. I shorted the far end, and only use the center conductor at the radio. If you do not short the far end the shield will cover up the center conductor from receiving very well. Several hundred feet works good for me.

Hi Jerry,

How is the susceptibility to man made noise with this antenna on VLF, MW, of course HF? I don't know if you tried it or not on all those frequencies, but it makes for some interesting possibilities here on this end.

Thanks,
Bill/K1FPV

8746. 566 Automatic Antenna Tunner

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-08 23:55:40 UTC
From: Marty
Topic: 8746 Message: 8746

Onno and everyone:

Got my 566 back from TT service today. Wanted to give you an update. Heavy sigh. Here's what I just wrote to them:

Dear Paul:

I received my 566 (OrionII) back today from your factory service. Please reference Invoice #XXXXX / Order #XXXXX. The technician reported repairing a broken solder connection on U6 of the AT board. Thank you for your prompt service and not charging me for the repair.

I have put the Orion back my station position and tried out the AT on my multiband doublet. The antenna tuner now, when enabled, searches and seems to find a minimum SWR consistent with the way the manual describes. It also acts, when disabled, consistent with how its described in the manual.

After observing a very satisfactory SWR displayed on the screen after the conclusion of the tuning process, and seeing the word "tuned" displayed then, THERE IS STILL A PERPLEXING PROBLEM. Upon commencement of normal transmitting immediately after the tuning process, and not changing frequency, the SWR displays "HIGH SWR" or sometimes "5.0:1 SWR" or the like. My expectation would be that it would continue to display the low satisfactory value that it had just found during the immediate prior process. I have no way to verify what the actual SWR is within the radio itself, but it seems to be transmitting full power, and not folding back.

I have, again, performed a RAM CLEAR and MASTER RESET with no change in symptoms.

This is really my first experience with the AT actually "working" after my purchase in March, so I'm not used to it. Is this normal? If it is, I don't like not having good info from the display on how the antenna is doing. If it isn't, then I'm dissatisfied with the service just performed.

Please look into this as soon as you can and get back with me. SS-Phone is coming up very soon. I've already missed SS-CW using my new radio, but I was not all that disappointed with my Eagle, its a great radio too and I enjoyed using it! But I'd really like to use my OrionII for SS-Phone and I don't have room on my desk for both the O2 and my manual Palstar tuner.

Thank You

Kind Regards

Marty Young / W4MY

I just tried my O2's antenna tuner and if I read your results correctly mine acts similar. When I press the AT button I see a 1.9:1 and after the tuning stops I see "tuned" in the display, I then start sending cw and now I see "SWR HIGH" in the display as I'm transmitting. This has always been confusing to me but I guess the O2's limited processor capabilities can't actually display the final SWR.

I never use the O2's internal tuner opting for an outboard auto tuner which has a wider range.

I hope this helps. Maybe others will chime in with their tests.

My Orion II internal tuner tunes a relatively resonant 40m dipole down to about 1.2 to 1. And the display usually stays that way when I begin having a QSO and during the QSO. However, it sometimes changes slightly, say to 1.4 to 1 during a transmission but never says 'high SWR' or 5.0 to 1 as you stated. That indeed does not sound right. What kind of antenna are you trying to tune...if it is a bed spring, it might be a bit much for the Ten Tec tuner. I believe it is for only fine tuning a relatively resonant antenna to begin with...

...but an antenna way out of whack to begin with might exhibit the behavior you are experiencing.

John and George:

Thanks for the helps. If this is "normal" I don't like it, but like you I can live with it as long I know it's all working ok.

John, the antenna is a doublet 110' fed in the center with 450 ohm ladder line about 40' in the air. I've got a Balun Designs double core 4:1 balun of which the unbalanced side goes into ANT1 of the 566.

It's a pretty classic design and the auto tuner in my previous Japanese rig had absolutely no problem with. (BTW the Japanese rig continued to display tuned SWR condition after tuning throughout the subsequent transmitting)

The Orion AT seems to find the right match quickly now, but the display is back to a bogus SWR upon starting transmitting. Whether this is the real situation or just a display anomaly we'll find out, Onno, do you know anything about this?

Thanks

Marty;

In my testing of the O2's AT I did find that if the O2 seems to find a match, not really, very fast that is an indication that it will not tune. When this happens I know the antenna is not tuned.

As I said, the O2's tuner is not wide range enough for me so I use the MFJ 998 auto tuner.

By the way my antenna is the same as yours except that mine is 260 feet long.

I know it is not in one box, but the LDG AT-200ProII is a generic 200 watt auto-tuner with quite a few features including memories, etc.

Again, I know it is a different box (and I do like things in the same box myself), but for the same retail cost, the feature difference does seem quite large between the LDG tuner and the Orion internal tuner. Just a thought?

HI Marty,

I may have had the same situation with my Orion tuner. When I used it on my loop it would give me crazy SWR readings and even when I used the tuner into a known good match it do the same thing. I called Ten Tec to get help and all they said is that the tuner memory is still filled with the old settings and it had to be cleared. They told me to do a Memory dump and Reset. I did this and still the same thing. I did noticed that when I tapped the cabinet the SWR reading would change.

I wound up removing the top cover and while the rig was in the transmit mode (CW 20 watts), I took a thin wooden handled paint brush and started pushing on the different boards. When I pushed on the Board on the top left rear side of the rig as you look at it from the front and top. It is the one with the toroid's and relays. I noticed that the SWR would change.

I turned off the power and unplugged the rig from power, and removed the screws holding the board, so I could lift it up to look at the bottom side. I found a few bad solder joints because some of the wires on the toroid's did not go through the holes, they were flush with the bottom of the board. So I pushed the wire in as far as it would go and re-soldered every connection on that board.

Walla, no more problems, now the SWR in the rig reads like the SWR meter in my external bridge.

This was what happened to me and it was a pretty easy fix. Just a suggestion, maybe you have the same situation. I don't know for sure, but it is worth knowing about.

Good luck.

Tnx,
Bill, K5LN

Bill,

That sounds like the AT board and TT reported fixing one bad solder joint.

I will take a look at it. Thanks much for your insight!

And regarding the outboard LDG, I recall reading about an after market AT board for the Orion made by LDG that was vastly superior with memory, but is no longer I production

To second what Tom brought up, I use the LDG PRO 200 on both my Orion and Omni 6. I purposely ordered my Orion without the tuner, as the Pro 200 does such a good job.

I would think that something could be done on Ten Tec's part to alleviate this problem. To send a rig back because of a malfunction while upgrading should be far in the past.

I would think a format and re-load should be part of TT's process with this type of problem.

What did TT say about this?

George thanks for answering.They basically told me that I need a new logic board.This was 2 months ago .They need to do a run of logic boards for the 565 which I am waiting on.I cant seem to get a straight answer from them as top why this would happen.I know this happens to others and is not reported,they even admitted as much to me.There is nothing wrong with my serial connection or my computer .This malfunction will cost me 6-700 dollars minimum .The 566 logic board is different than the 565 as the 566 uses the newer dragonball processor .They are not interchangable .Thanks Alan WA2AC

8763. Re: [orion565] 566 Automatic Antenna Tuner Fixed

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-13 15:04:57 UTC
From: w4my@yahoo.com
Topic: 8746 Message: 8763

Well, found the problem.

When my 566 returned from TT it still exhibited AT problems, but different.

Found a broken point near the antenna balun in the ladder line. Fixed it.

Orion's automatic AT is working as advertised now.

Reported this to Paul at TT. All is well. Thanks everyone for helping me through this. Having two problems simultaneously (cold solder joint in AT and broken wire in antenna) was a tough one!

Now I'm going to concentrate on the things I LIKE about this rig! I'm still very glad to have it!

73 Marty / W4MY

PS: At my most exasperated point I ordered an LDG Z-11. I'm going to keep it and put batteries in it to go with my Eagle on expeditions. Win-Win! HI!

8765. 565 problem

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-14 20:54:57 UTC
From: wa6iaf
Topic: 8765 Message: 8765

Hi Everyone,
This morning when I tried to transmit on SSB I found there is no power out from my OrionI.

There was no audio when listening to monitor.
Tried another known good mic, same thing.

CW was fine on both Tx and Rx.
100W out, everything else OK too on CW.

Oddly, the display was washed out and I needed to adjust it's contrast way down from the usual 75 to 35 for it to look right.

I turned off main power sw on rig, removed 13VDC power supply and let sit 5 minutes.
Turned back on, same thing, no power out on SSB, CW A-OK.

Tried master reset by holding in main tx/rx button in while turning power switch on...it hung there with no "Master Reset Complete" message appearing...blank screen.

Turned off power waited a while and turned power back on, screen now has multiple horizontal black bars on top 1/3 and rig is dead, won't boot.

I wanted feedback from the group here before opening up to check the battery.

Any thoughts, suggestions appreciated.

Probably the "good old" A9 Cap problem rearing it's ugly head...

Thanks Tom,
Boy that was a fast answer!
I only came back here so soon to say I checked in the Tx menu to be sure all antennas selected were correct, Tx set to on, no transverter, etc, etc...all OK there.

Going to look at instructions for the sweep mod and ver 2 softwary. I'm running ver 2.063 ? (062? can't look, no system loading msg) and like it

Thanks Peter,
I'll check the caps on the A9 board when I have it open.
Right now I'm going to put the old Corsair back on the air, time I used it a little while anyhow!

Will post what I find out in a day or two.
73
Paul

I'm skeptical that it's the battery, but you never know.

I would bring some audio into the aux in and try that in ssb (with TX Audio Source = AUX) to rule out an issue in the Orion mic preamp circuit. If you don't have an external mic preamp, just hook your computer soundcard to it and play some .wav files etc

8772. Orion, Flaky encoders

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-15 15:04:18 UTC
From: Martin Sole
Topic: 8772 Message: 8772

Really just starting to notice that all of my encoders are a bit flaky. I don't tend to use RIT very much, I'll A>B and split as a rule, but I see the RIT encoder will not move other than to flash the minus sign but I also see the multi encoder is flaky, it changes but hesitates and jumps and is not a smooth progression either up or down. Same with the L-H cut and PBT/BW controls. The volume encoders seem better.

I recall this coming up here before; is it just the plug connections or is more work generally required? Would like to clear it up in one round of disassembly if possible.

Thanks

Martin, HS0ZED

I called Ten-Tec about my multi control doing the same and was told it is a major opertion to fix and factory repair was the solution. If anyone knows better let me know. Can't afford to send back to the factory.

The volume control on my 566 sometimes has a mind of its own...and
decides not to turn volume up or down.

I just give a lil' tug on the knob and she's good to go again. I've come
to conclusion that the rig is just quirky in some ways. Luckily the
overall performance of the transceiver outweighs the quirkiness!

If I remember correctly, you might want to check the TenTec Wiki for the encoder problem. After some folks replaced their encoders, someone found that the problem was actually related to intermittent connections at the off-board wire connectors. Again, if I remember correctly, removing and reseating those connectors solved the problem. I don't recall if new connectors were required, but if removing and reseating them worked, you might want to try a tiny drop of Deoxit on each pin before reseating. I haven't had my 565 on and operating in quite a while, so I'm betting I run into both this problem and the dead (or dying) battery as well . . .

8779. More encoder woes

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-16 06:58:43 UTC
From: Martin Sole
Topic: 8779 Message: 8779

Well I read the wiki, and looked in a few other places and came to the conclusion I needed to pull the front panel and do some contact cleaning/re-seating to clean up my intermittent encoders. First order of business seems to be to remove the 6 small knobs but it seems I am already stuck, or rather they are. I had presumed them to be just push on but that might not be the case. I saw no set screws so gave a firm pull on the multi knob only to have it come away with the shaft from the encoder. Not a good start! Testing all the others they seem equally well attached so short of destroying all 6 to get them off what am I doing wrong?

I don't think you have to pull the knobs Martin. Remove the top/bottom covers and you'll see the screws that hold the front panel. Consult the V2 Mod installation document that is linked on the wiki.

Did you use the same knobs ?
I've always said that one of the downfalls of the ORION radio are the "cheap" looking plastic knobs. Not only do the look cheap, they feel cheap too. Considering that is almost my only complaint, not bad.

I likely will re-use them, if I can get them off. I wish they were of cheap design, at least then they might crumble off the shafts. As it is they seem glued on. Possible they are I suppose.

Would be nice to have nice aluminium knobs like Kenwood and Yaesu used to use. Wonder if there might be a market for some super heavy machined knobs. Might add a touch of class to a very classy radio!

I've have all my knobs off by just pulling them off. I don't know why your knobs are stuck on???

Subject: [orion565] More encoder woes

Well I read the wiki, and looked in a few other places and came to the conclusion I needed to pull the front panel and do some contact cleaning/re-seating to clean up my intermittent encoders. First order of business seems to be to remove the 6 small knobs but it seems I am already stuck, or rather they are. I had presumed them to be just push on but that might not be the case. I saw no set screws so gave a firm pull on the multi knob only to have it come away with the shaft from the encoder. Not a good start! Testing all the others they seem equally well attached so short of destroying all 6 to get them off what am I doing wrong?

Don't know either George. I'm loathe to pull hard on them again in case more disintegrate. I can only surmise that maybe they have been stuck on. The encoders look surprisingly like one we use on our G/A radios. Does anyone have a generic part identification for these? I might be able to source them locally.

I recently replaced the knobs with the chrome trim ring with all-black ones. I got them from the factory one day while visiting there. To remove the knobs, gently pry the chrome (or black) trim rings off with your fingernails. Then you will see small setscrews. Loosening these setscrews lets you remove the knob. Unless the setscrews are loose, you can't easily remove the knobs by pulling on them. I, too, have the RIT encoder problem and Paul told me it wasn't an easy fix, too.

I just ordered the encoders from Ten Tec.

The encoders are mechanical encoders as opposed to optical ones.

As I said, I changed all of the encoders on my O2 while I had it apart.

I'd just call TT and order the encoders from them as I did.

It is a daunting task to change the encoders but if you are meticulous as to the removal and un-soldering and re-soldering you should be successful.

If you don't feel comfortable with self-repair I'd send it back to TT.

Ten Tec has always used plastic knobs on their radios. Metal would be nice. I remember Hallicrafters has plastic knobs also, and, probably a lot of the manufactures. It least it would keep knobs from splitting and breaking. Some of the Collins I think have Bakelite.

I believe the RIT encoder problem is still not fully understood. The current best guess is that it's a connection problem. The factory believed replacing the connector on the 565 with the connector used on the 566 would fix the problem but that fix only lasted a few months on my 565. If DeOxit on the connector pins doesn't fix the problem for a couple of years or more (I haven't tried this yet -can anybody comment?), then encoder replacement might be the only option. But I wouldn't want to use the same type of encoders. I'd want to find a more robust replacement.

From: Rod Greene
Topic: 8772 Message: 8792

When my regulator board caps started giving me a problem, the first thing I did was to pull the front panel. It's not a big job to remove the panel. IIRC, once the top and bottom covers are off, the front panel has 4 small screws on top and 4 on bottom and 2 on each side. When the screws are removed, you just pull the front panel away from the chassis. I pulled each of the connectors and sprayed them with Deoxit Gold and then replaced them. Was a little messy, so use restraint with the spray. Or put some spray on a swab and use that to apply.

Now all my front panel controls work like new. No more RIT, etc problem. Was worth the work...

After that I replaced the caps and that took care of the main problem.

Hope this helps a little.

I agree it is not fully understood. In my case, the rig is new and less than a year old. The problem with my main volume control only occurs when I happen to flip over to the sub AF knob for a while then return to the main AF knob. It appears more like a logic problem than a poor mechanical or electrical connection. Going from main to sub and back to main AF makes the main AF stop functioning. However, a slight tug on the main AF makes it immediately functional. Of course, to make things interesting it does not do it every time...

Well I now have the knobs off, and the front panel detached from the radio. DSP and display board removed. Now I'm stuck fast again. The daughter board is plugged into to the main front panel board and there are white plastic collars on each of the encoder shafts. Don't want to force the board and risk breaking it so what is holding it in place. Do I need to remove the overlay with the lettering on.

Figure one of you guys that has been here before might offer a blow by blow.

Thanks
Martin, HS0ZED

Excellent observation Dick. I totally forgot that there was a set screw on the knob.

I recently replaced the knobs with the chrome trim ring with all-black ones. I got them from the factory one day while visiting there. To remove the knobs, gently pry the chrome (or black) trim rings off with your fingernails. Then you will see small setscrews. Loosening these setscrews lets you remove the knob. Unless the setscrews are loose, you can't easily

remove the knobs by pulling on them. I, too, have the RIT encoder problem
and Paul told me it wasn't an easy fix, too.

Sorry Martin, but I haven't gone there myself.

It would be great if you could take some photos as you proceed in order to document it for the future.

I was under the impression that the RIT cable connector would be easier to access but I guess not.

Not taken any pictures yet but somewhat further forward.

The whole front panel has to be disassembled. That means all the screws holding the big pcb on have to come out and the board lifted off the plastic front panel.

Then the white plastic hexagon nuts can be removed from the front of the big pcb. With that done the encoder daughter board can be removed from the main front panel pcb, careful with the white plastic spacers!

I've gone a bit further. Removed the damaged encoder from the front daughter board, Carefully pryed it apart, separated all the internals and rebuilt it fitting the circlip back around the shaft. Big magnifier essential. Looks and feels ok and seems to be alright. Next will be to test it which will require at least partial re-assembly.

Close to 11pm here now so more tomorrow I think.

Feeling better.

8798. 565 problem__SOLVED

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-16 17:26:45 UTC
From: wa6iaf
Topic: 8798 Message: 8798

Turned out an electrolytic on the A9 board failed. C6_1 which should be 470mfd/35v. Measured only 76mfd.

A visual inspection of the A9 board revealed that cap had bulged out on it's top.
Also where the stamped lines in case met there was a pin-hole letting electrolyte escape.
So it was easy to find the culprit once the A9 board was suggested by the group as being a place to look.

Thank you!

Both of the 470mfd caps on the A9 board in my 565 are 105 C temp rated. Don't know if that's original or not as I bought the rig second hand a couple years ago.

Found a pair of old axial lead Siemens electrolytics rated at 470mfd/40v date code 12_1979(!) from my junque box and put one in until the replacement caps arrive.
The one I installed being so old, I monitored it's temp a while.

What a relief! My Orion I is all better now, everything working as it should after this easy repair.
Sure is nice having the chassis so roomy.

BTW, after having been in storage 2 years the old Corsair worked just fine.

73 one and all,
Paul

Don't know either George. I'm loathe to pull hard on them again in case more disintegrate. I can only surmise that maybe they have been stuck on. The encoders look surprisingly like one we use on our G/A radios. Does anyone have a generic part identification for these? I might be able to source them locally.

Thanks

Subject: [orion565] More encoder woes

Well I read the wiki, and looked in a few other places and came to the conclusion I needed to pull the front panel and do some contact cleaning/re-seating to clean up my intermittent encoders. First order of business seems to be to remove the 6 small knobs but it seems I am already stuck, or rather they are. I had presumed them to be just push on but that might not be the case. I saw no set screws so gave a firm pull on the multi knob only to have it come away with the shaft from the encoder. Not a good start! Testing all the others they seem equally well attached so short of destroying all 6 to get them off what am I doing wrong?

Hi, my name is Guillaume VA2NA.. I experience the same problem as you. Volume is low on headphone but not on speaker... Switching to Bin RX increase the level at "right" level.. My pseudo solution is to use the headphone connection on my Yaesu external speaker.

Thank you

There are 33 ohm resistors in series with both leads at the headphone jack. You can lower that resistance and get more output. I shunted those resistors with 18-ohm resistors on my Orion.

Date: 2012-11-17 01:14:32 UTC
From: Martin Sole
Topic: 8779 Message: 8803

Hi George,

Well it sometimes is a bit of a pain but then again it can lead to some inventiveness. I managed to get the encoders off and have rebuilt the broken one. It looks and seems to work fine. Having stripped cleaned and reassembled the whole front panel, quite an experience, I feel quite good. Hopefully it will last a good more few years.

As to the other chap who mentioned sending just the encoder board I think I will order a spare. I did send them the logic board for repair a year or two back and that worked out fine.

Anyway the radio is now all back together. I have a strange pulsing noise from the sub receiver and its S meter is at about the 10 over 9 position Looks like I might have a cable in the wrong position on the logic board :(

Subject: RE: [orion565] More encoder woes

Don't know either George. I'm loathe to pull hard on them again in case more disintegrate. I can only surmise that maybe they have been stuck on. The encoders look surprisingly like one we use on our G/A radios. Does anyone have a generic part identification for these? I might be able to source them locally.

Thanks
Martin, HS0ZED

Well I read the wiki, and looked in a few other places and came to the conclusion I needed to pull the front panel and do some contact cleaning/re-seating to clean up my intermittent encoders. First order of business seems to be to remove the 6 small knobs but it seems I am already stuck, or rather they are. I had presumed them to be just push on but that might not be the case. I saw no set screws so gave a firm pull on the multi knob only to have it come away with the shaft from the encoder. Not a good start! Testing all the others they seem equally well attached so short of destroying all 6 to get them off what am I doing wrong?

Hi, Me again. Also next time take a bunch of digital pictures when taking it apart. then you have a guide when putting back together. also works
for small clocks and engines... I have a great memory, but it is very short...:) tom N6AJR

In a message dated 11/16/2012 5:14:36 P.M. Pacific Standard Time, hs0zed@... writes:

Hi George,

Well it sometimes is a bit of a pain but then again it can lead to some inventiveness. I managed to get the encoders off and have rebuilt the broken
one. It looks and seems to work fine. Having stripped cleaned and reassembled the whole front panel, quite an experience, I feel quite good. Hopefully it will last a good more few years.

As to the other chap who mentioned sending just the encoder board I think I will order a spare. I did send them the logic board for repair a year or two
back and that worked out fine.

Anyway the radio is now all back together. I have a strange pulsing noise from the sub receiver and its S meter is at about the 10 over 9 position Looks like I might have a cable in the wrong position on the logic board :(

I just ordered the encoders from Ten Tec.

The encoders are mechanical encoders as opposed to optical ones.

As I said, I changed all of the encoders on my O2 while I had it apart.

I'd just call TT and order the encoders from them as I did.

It is a daunting task to change the encoders but if you are meticulous as
to
the removal and un-soldering and re-soldering you should be successful.

If you don't feel comfortable with self-repair I'd send it back to TT.

8807. RE: [orion565] More encoder woes

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-17 03:58:18 UTC
From: Martin Sole
Topic: 8779 Message: 8807

I pulled it apart, unintentionally of course. Recalling what I read about a firm grab of the knob to fix the intermittent RIT I was somewhat surprised when the knob came away with the shaft still attached!

The way the encoder is built the shaft has a groove about 4/5ths of the way down, beyond this the round profile transitions to having two flats. The shaft also has a stepped profile so it will only push in so far, once fitted there is about 1mm play to allow for the switch operation.

I started by removing the encoder from the pcb, then I carefully squeezed together the securing prongs that hold the mounting plate on. With this removed the encoder breaks down into its constituent parts. Working from the front there is the shaft that passes into the cast housing, the shaft is held in place both by its stepped profile at the front and on the back of the cast housing by a small circlip, this is what gave way when I pulled on the knob. A ring of contacts sits inside the housing, the hole in the middle of this mates with the end of the shaft. A plastic plate is next that holds the mating contacts for the encoder ring and routes them to the external pins. After this there is a thin plastic plate that provides a cushion and insulator to the metal dome switch that is on the rear most plastic plate. The whole lot sandwiches together and is held together by the metal mounting bracket and the clips that splay apart to hold it in place.

To repair it I had to strip it down, re-fit the shaft and secure the circlip, then rebuild. An illuminated magnifier and jewellers style loupe were essential.

So far so good. It's all back together again and working as it should. There is no sign that the repaired control is any weaker though I see no point stressing it more than necessary, if anything it is a little smoother. I will be looking at replacements for the spares pack just in case.

Regards and thanks for all the tips that got me this far.

Martin, HS0ZED

Martin;

Good to hear that you got that darn thing back together.

You're now an expert, hi.

Good DX and 73's.

Subject: RE: [orion565] More encoder woes

Hi George,

Well it sometimes is a bit of a pain but then again it can lead to some inventiveness. I managed to get the encoders off and have rebuilt the broken one. It looks and seems to work fine. Having stripped cleaned and reassembled the whole front panel, quite an experience, I feel quite good. Hopefully it will last a good more few years.

As to the other chap who mentioned sending just the encoder board I think I will order a spare. I did send them the logic board for repair a year or two back and that worked out fine.

Anyway the radio is now all back together. I have a strange pulsing noise from the sub receiver and its S meter is at about the 10 over 9 position Looks like I might have a cable in the wrong position on the logic board :(

Subject: RE: [orion565] More encoder woes

I just ordered the encoders from Ten Tec.

The encoders are mechanical encoders as opposed to optical ones.

As I said, I changed all of the encoders on my O2 while I had it apart.

I'd just call TT and order the encoders from them as I did.

It is a daunting task to change the encoders but if you are meticulous as to
the removal and un-soldering and re-soldering you should be successful.

If you don't feel comfortable with self-repair I'd send it back to TT.

Don't know either George. I'm loathe to pull hard on them again in case more
disintegrate. I can only surmise that maybe they have been stuck on. The

encoders look surprisingly like one we use on our G/A radios. Does anyone have a generic part identification for these? I might be able to source them locally.

Thanks

Subject: [orion565] More encoder woes

Well I read the wiki, and looked in a few other places and came to the conclusion I needed to pull the front panel and do some contact cleaning/re-seating to clean up my intermittent encoders. First order of business seems to be to remove the 6 small knobs but it seems I am already stuck, or rather they are. I had presumed them to be just push on but that might not be the case. I saw no set screws so gave a firm pull on the multi knob only to have it come away with the shaft from the encoder. Not a good start! Testing all the others they seem equally well attached so short of destroying all 6 to get them off what am I doing wrong?

8810. Problem with Orion II and N1MM Logger

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-17 18:25:14 UTC
From: Rod Greene
Topic: 8810 Message: 8810

I know this is just before SS SSB .....

Problem:
When I click
on a function key to send a .wav file, something in Logger resets my
Mic gain setting on the Orion to zero. If I turn up the Mic gain setting
while the .wav file is playing, the audio gets transmitted. Then when I
click on a function key the next time, the Mic gain is set back to zero
again. After the message plays, the Mic gain is restored to normal
level. Don't know if that makes sense. It's just when the function key
is pressed and the message is playing, that the Mic gain gets set to
zero. After the message is done, the Mic gain reverts to normal setting.

I have been working on this for hours, and can't find the setting that does this.

I tried using an old version of Writelog and it works fine for playing recorded messages.
ie, it doesn't mess with
the Orion's Mic gain.

By the way, I'm using an original MicroKeyer for the interface. However, I don't think it's the problem.

Sure would appreciate some idea of what to look for. I'll cross post this to the Orion reflector.

Thanks and 73. Good luck in the SS

Rod/w7zrc

Go into the Configurer and look at the Other tab - see if the "Mute mic on supported radios" box is checked. Uncheck it if it is and see if that fixes it.

8813. Orion 565 tune button problem

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-18 04:59:35 UTC
From: Michael Carter
Topic: 8813 Message: 8813

I pushed the tune button on my 565 as I have done many times before, and the Orion started transmitting low power as always. SWR was good and I pushed the tune button again to return to receive and the tx would not stop. I had to turn off the 565 and power on to go back to regular operation. After several times of this, I did a master reset but it did not correct the locked in tx issue.

From: John
Topic: 8815 Message: 8815

All,

Had my Orion II for a while now and still figuring out all it can do. I have been using the "parameters" function almost since I got the rig without difficulty. Silly me, during the Phone Sweepstakes Contest I stumbled on the "registers" function. In the middle of the night I pushed a bandswitch twice and the "A" turned to a "B"! And then I learned there is also a "C" and a "D".

Can't really find any documentation on this function. So I have four band registers and my question is what do they do and how are people using them?

Tnx,

John, K4SQC

8816. RE: [orion565] Parameters Versus Registers and How to Use Each

From: Duane Calvin
Topic: 8815 Message: 8816

They hold four different frequencies/modes for each band, and everyone seems to use them differently. I keep mine in order - A = CW portion, B = PSK-31, C = RTTY, and D = SSB. The only drawback to my method is that I have to switch bandstacking register before I pounce on a spot if I'm switching modes. But it gets me around the bands quickly and gets me set up to use whatever mode I'm headed for. For what it's worth. Now others will tell you how they use it!

Hello group. I am very interested in the Orion II and currently have the FTDX-9000D. I want to try something new and I have heard great things about the Orion II. Can anyone provide any comparasions between the 9000 and the Orion II. The other radio I am looking at is the Flex 6000 series. I am not keen about a computer based radio nor have the time to learn all the capabilities it has, but it is a nice mouse radio when it comes to features. I like knobs and and a real radio. I would love your thoughts to my original questions. Thanks again.

From: w4my@reagan.com
Topic: 8817 Message: 8819

Hello Will

I have owned my Orion 2 since March of this year. All in all I am glad I got it. The best radio I had before this was an FT-1000MP I had optimized for contesting. I liked that rig allot when I used it.

After contesting with the O2 there is no comparison. I could go on and on with anecdotes of how well the receiver performs and the absolute pleasure of the filtering like I've never heard before, but this is all common knowledge. The Orion is much easier to understand and use than the 1000MP.

In my DXing, I have attached an amplified Wellbrook 1780 receiving loop to the receiver only input and route that to the independent second receiver. I set up diversity receive and I am awe struck at the sound! Sometimes I just pause and listen to the white noise barely audible in the background and get teary-eyed it sounds so good! But when I come to my senses, I go for the DX and kick in the SAF and the ESP level signal pops up to Q5. I'M NOT EXAGGERATING!

That said, this rig is not for everybody. If slick and neat man to machine interfacing that the Japanese have perfected so well in their rigs is important to you, then this rig may not be for you. This rig is basic, basic, basic when it comes to fiddling with it. You have to use this rig a while to appreciate why you spent so much $$$ for it. My first impression a few days out of the box was not positive. I would think after messing with the front panel, "My gosh man, this is a $5K radio! Was this thing built in a garage?" Read the QST review published about 5-6 years ago and it will give you an idea of what I'm talking about.

But if you want a radio that PERFORMS then there are few competitors, and the offerings from Japan are not among them. The only reason I didn't go K3 is because I found Elecraft more difficult to use. Then when I listened to my friends O2 on SSB, that sealed it for me.

I hope this was helpful Good Luck! 73 Marty / W4MY

Hang on to your Yaesu while you take a 30 day money back guarantee Ten Tec test drive. You can't lose (sans shipping) and that way you can make your own comparison.

I have no experience with the '9000 but have found the receiver in the Orion II to border on perfect for my ears. The best way I can describe it is the lack of listener fatigue due to the low noise floor.

We all know Beauty is in the eye of the beholder. I happen to like the Orion II's somewhat spartan looks. I'd call it refreshening, really. But one word of caution here: the built-in scope, while useful for displaying band activity, is certainly nowhere close to even my IC756 Pro II.

Again, check out that 30 day Ten Tec test drive.

I've found the Orion II appears to be best appreciated by experienced hams. An experienced ham will know in short order what the Orion II brings to the table.

Will,
I have been remote for over six years now.My original set up was a Orion II and a Omni VII. They are both great radios. They are a different radio than the 9000. If you use the Orion II then you will want to use the
n4py software with it. You can have a remote tuning knob to go with it you like. If you are into controlling a radio with a mouse you will want a free wheeling mouse. I became so adept with this combination that it was hard to operate a radio with knobs. However, along came Elecraft with K0 and a K3 combination. This configuration allows you to keep your knobs and still operate remote. The K0 controls the K3 remotely. It uses the remote rig control boxes. I control a complete station remotely. That includes a Alpha 87A amp., Yaesu 2800 antenna rotator, select 10 different antennas, operate a DX Eng. 4 sq, control a MFJ 988 antenna tuner, a K3 and a KP500 amp. If you are interested give me a call and I will be happy to pass on to you my experience. You can reach me at 865-556-6390, or I will sked with you.

I removed the front panel and can see the small daughter board that the encoders are mounted on, and the connector that couples this to the main front panel switch board. To remove the daughter board I would assume I need to withdraw the encoder shafts back through the front panel, hence my wish to pull the knobs. Is there another way to separate the daughter board from the front panel board?

Thanks

I don't think you have to pull the knobs Martin. Remove the top/bottom covers and you'll see the screws that hold the front panel. Consult the V2 Mod installation document that is linked on the wiki.

Thanks barry,

That's a good read, and pretty much the sort of thing I recall but I'm curious that most of it revolves around the RIT, I have that problem, for sure, but with at least another 3 of the 6 encoders acting up it's either something else as well or the problem extends beyond the RIT as well.

Maybe the tropical weather doesn't agree with them.

From: John T. Fleming
Topic: 8822 Message: 8826

Mike,

You can make a "Y" female connector for the RG174 coax and then split the line for the sub-receiver and insert the "Y" and take the third piece of coax and connect it to the "spare" connection of the connector board mounted on the back of the Orion. The IF is 14.5 KHz but does not seem to be a problem. I use DReaM software which is free. I purchased the original DRM software but then needed an update to a later version of Windows. That is when I found DReaM. You can download it from http://sourceforge.net/apps/mediawiki/drm/index.php?title=Main_Page.

73,

John

Subject: [orion565] Orion 1 and DRM?

Any off list input form someone doing this appreciated. I beleive I need some sort of tmp y connector to get IF out of the radio. Are these available pre-made?

Positive input appreciated.

Hello Martin,

Before you go and take your Orion apart. I would like to share the experience I had with my Orion and encoders.

I have an original Orion (made back in 2004) and my RIT and other controls were getting flaky and not always working as they did when it was new. Well, my memory battery wore out and needed to be replaced. While I had the front panel off to replace the memory battery, I remember reading in an email that the issues with the encoders may not be the encoders themselves, but the connection in the ribbon connectors. I removed the ribbon cables and sprayed contact cleaner/lubricant in the connectors to get the cleaner in the holes. Now this does not mean that in your situation you do not have a bad encoder. But before removing everything I would recommend spraying the contact lubricant into the ribbon connectors first, and see how that works. It brought my Orion back to where all the encoders worked just like new. If the encoder is really bad it will show up right away after cleaning the connector connections.

Good luck and best wishes with you Orion.

Tnx,

Bill, K5LN

Subject: RE: [orion565] More encoder woes

I removed the front panel and can see the small daughter board that the encoders are mounted on, and the connector that couples this to the main front panel switch board. To remove the daughter board I would assume I need to withdraw the encoder shafts back through the front panel, hence my wish to pull the knobs. Is there another way to separate the daughter board from the front panel board?

Thanks
Martin, HS0ZED

I don't think you have to pull the knobs Martin. Remove the top/bottom covers and you'll see the screws that hold the front panel. Consult the V2 Mod installation document that is

linked on the wiki.

8829. T*T Batteries

Yahoo group: orion565 (2009 — 2013)
Date: 2012-11-25 21:05:15 UTC
From: Sam W Jacobs CET
Topic: 8779 Message: 8829

A thought just occurred to me.

I'm referring to the lithium battery located on the ORION radios. All of these batteries are suppose to have a
10 year life span (as told to me by Ten*Tec engineering) however we as users are replacing them left and right.
On my ORION II I've had to replace two of them (and pay for one of them). This isn't right.
Replacing them isn't fun either as they are located behind the front panel, not a fun fix.

I have three suggestions for Ten*Tec. First, find another supplier for these batteries as some aren't lasting more than
a year or two. Second, locate these batteries more towards the back of the radio so that replacing them only
requires removing two screws and popping in another battery. Finally, they could do better using a watch-type
battery, say a 2025 or 2032, or even move towards a AA type rechargeable.

My three cents worth.

73 !

From: nr0t_mn
Topic: 8831 Message: 8831

I recently installed the RX-366 in my Orion 565.
I have not yet installed any additional filters.
Is the one which shipped at 2.4 KHz filter?
Is anyone using InRad filters on the RX-366?
If so, which ones?
When I search their site, nothing comes up. Do I select the ones for the TenTec Eagle?

On an unrelated noted, does anyone know of any documentation for the Orion menu items which were created in newer versions of the firmware?
I have checked the Orion Wiki with no luck.

Tnx

Hi Sam,

This brings up a good point! I own an Argo V, 526(6N2),original green screen Jupiter, Omni VII and an Orion II....not to mention 3 Ten-Tec Receivers. (RX-320D, RX-340 & RX-350) I've had each of them open for repairs or modification at one time or another. You know, I've never paid any attention to the battery in them if there is one in them.

I think I for one will begin a process of looking for and changing batteries if there is one in the piece of gear every time I open them up for any reason.

73,
Bill/K1FPV

Jerry,

I happen to have a full station I am being forced to sell to sell because of medical disabilities.

One of the items includes a Orion II with internal auto tuner, remote tuning knob, matching speaker and all 3 filters. The other 3 station transceivers in include K3/100, Flex-5000, and IC-7000. None of these have been offered prior to this email.

If your friend (or anyone else) is interested, contact me directly at k8waw at att dot net. Additional info at www.QRZ.com/db/k8waw

Where can I find the specification on the Ten Tec Orion as they compare to the Orion II.

I am also looking for information on decoding the Ten Tec serial numbers as they pertain to month and year the product was produced.

Pete

Go to the Sherwood Engineering website, Bob has specs for alot of radios on there..

Here's a link to his webpage with the receiver specs on it.

Receiver Test Data (http://www.sherweng.com/table.html) or _http://www.sherweng.com/table.html_ (http://www.sherweng.com/table.html) if the forst link doesn't work..

Sorry for the probable repeat of a topic I expect has been
discussed here before.

I got a new Windows 7 Professional based computer with no serial ports.
I have HRD 5.23 so I got a Ten Tec Serial to USB cable.
It works with FLDIGI and XMLOG, but does NOT allow HRD
to connect and read the frequency. (For that matter HRD does
not work with my Kenwood TS2000 with serial cables either.)

I sent a note to Ten Tec asking and talked via phone to the
cable maker. The former did not answer. The latter did not
know the answer to my question: what is the solution or if
unknown, what should I try next?

Thanks for your patience with me.

I'll 2nd the recommendation of a Keyspan HS19.

I use one at work to update firmware on older Unix boxes, for connection to some disk drive arrays, for tape arrays and console access to Alpha systems. Works EVERY time, no problem.

I bought a second one to dedicate to my home system.

Very much worth the money.

When I went to W7, I had to replace all my usb to serial cables.

I went online, and bought some for W7, and they work on all my software/radio situations.

I don't recall the brand, just that they were W7 compatible.

Can someone confirm that you can still listen to AM RADIO (like 550 AM, 700 AM, 1530 AM etc)on this receiver like the original sub receiver in the Orion II??

Just want to be sure it's not a Ham Bands only receiver. Hey! want performance but now and then would still like to listen to a local broadcast station.

Hi Jim,
I have RX366 sub receivers in both of my O2s. Ten Tec came up with a mod to the rx366 that allows you to receive am broadcast band and it works well! I believe that the modified RX366 works BETTER than the original sub receiver because it has a 10 db preamp in it that the original sub receiver did not. They just keep making the Orions better and better!! I have got my other rx366 at TT now having the mod put in it too. The RX366 with the mod in it for me is the ONLY way to go.....and on some frequencies, it is a better receiver than the main receiver in the O2!!!! Simply Amazing!!

What is this mod that TT has to receive MW better than the Eagle?

I own both the Eagle, and Orion II. The Eagle receives MW down to 1MHz, then the sensitivity
drops off.

Talked to Stan at TT yesterday and he said there is no mod on the RX366 for MW. It is the Eagle mother board, and MW reception will be the same on the RX366.

I heard of a mod (don't know the details) that involved changing surface mount components on the RX366 board. It improves sensitivity for general coverage reception (down to 600Khz). I don't think it's an "official" Ten-Tec mod though.

Hi Jerry,
There is a Ten Tec mod for the Eagle as well as the RX366. They allow the owner to listen to the AM Broadcast band down to 540 khz. Contact John Henry to get the details. I love the mod to the RX366...makes it hear better than the original sub rx on the am broadcast band because it has a 10 db preamp installed where the orig sub did not!!

8861. Filters for RX-366 and LP-Pan

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-12 13:33:41 UTC
From: nr0t_mn
Topic: 8861 Message: 8861

Two questions about the RX-366 which I put on my Orion 1.

FILTERS: If this is the Eagle receiver board, I assume that if I want to get filters from InRad that I need to look up filters which are compatible with the Eagle? Last I checked they didn't have an RX366 compatibility index.

PANADAPTER: I got the 9MHz IF Cable from TT to connect to the spare jack on the back of the Orion. Has anyone successfully used LP-Pan or other Panadapter with the RX-366? If so, what needs to be done>

From: John
Topic: 8857 Message: 8862

Hi Jerry,

We have performed the mod for a couple of units, and were waiting for a bit of time to pass before we announce it to the public. It opens up the general coverage path to cover down to around 600khz. Which then covers what some were wanting. But it does "open the barn door", meaning it could have other ill effects if you live in an area like Chicago or Boston that have monster AM stations. So we were playing this one by ear to see how well it works, and then possibly slowly send it out to others.

It is a change to the preselector board, for both the Eagle and the RX366.
It involves changing the value of two SMT caps, removing 1 SMT cap and removing two inductors, "opening the door".

We do have to be careful doing mods like this because what happens when the units are in someone elses hands 20 years from now and the complaint is due to the mod and we get them in for repair? Anyway, that is our concern, not yours, but it makes working on rigs fun sometimes. We get rigs in that have 10 or so mods to them not fully understanding each and everyone, and still have to make it work. The fun.

Thanks, and 73,
John Henry, KI4JPL

Thanks John for the info. Just like my Orion II, I want my Eagle to be the best on HF. I have a Palstar R30A for other type listening.

I do live a half mile from a 50KW AM station, and again do not need my radio's caving in.

Jerry, ki4ps

It opens up the general coverage path to cover down to around 600khz. Which then covers what some were wanting. But it does "open the barn door", meaning it could have other ill effects if you live in an area like Chicago or Boston that have monster AM stations. So we were playing this one by ear to see how well it works, and then possibly slowly send it out to others.

> We do have to be careful doing mods like this because what happens when the units are in someone elses hands 20 years from now and the complaint is due to the mod and we get them in for repair? Anyway, that is our concern, not yours, but it makes working on rigs fun sometimes. We get rigs in that have 10 or so mods to them not fully understanding each and everyone, and still have to make it work. The fun.

8864. 565 average pwr on ssb

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-14 17:38:49 UTC
From: wa6iaf
Topic: 8864 Message: 8864

Hello all,
I've had this Orion 565, firmware version 2.062a for a year now and it's my Dream Machine on CW. What a great rig!

I also operate about 30-40% on SSB and am quite disappointed with the average power out. Normal speech is only somewhere between 5 and 10% of the 100 watt peak that shows on my Bird 43p. No processing used. Mic plugged directly into front panel connector, no extra audio processing gear external to the rig. It has a hard wall, sort of, on 4 different mic's tried. The Tx audio distorts with a click like sound or a pop on voice peaks way before I can get the average power up to a reasonable level. Does not matter how the ratio is set between the 3 audio gains, those being the HW setting inside SSB menu, the pot under front panel, and/or mic gain on front panel. Or the Tx EQ, Tx bandwidth, lf roll-off etc.

It's not RF feedback, does this with great RF ground.
Does it with perfect cables into Bird 50 ohm dummy load and no extra cables going into or out of rig. Just the power supply cord on which I have ferrite over each of the two wires just in case. And the mic is plugged in of course, to front panel.

Tx audio is beautiful until it hits that "wall" Then sounds like garbage with a sharp crash/crunching distortion on the peaks.
Mic's tried:
Shure 444 (low impedance)
MC-60 (low impedance)
EV 676 (wired to low imp.)
Brehringer Ultravoice XM8500
All these mics with proper impedance match work really well with my voice timber on my Drake TR7, Kenwood TS-940s/at, TT Corsair and S line. I see an average power out of around 45% of peak when on SSB with those other rigs.

It appears to me that as soon as the ALC light flashes on the Orion the distortion hits. Sounds beautiful running around 5-7 watts average power out.
It is NOT a matter of meter movement inertia as there is not nearly enough power to drive the AL-80B on SSB. I also have two other peak reading watt meters which measure very close to the Bird on avg and peak power.

The distortion is heard using cans on the Orion monitor,
it's heard on other Rx with no antenna on them,
see it on RF envelope on scope.

Never have been able to use the processor with this firmware version.
It distorts even at setting of 1 and audio level/ALC is way down.
Can not find a mic gain/SP gain setting to clean it up.
I've seen comments on the group that's a common issue with the firmware version of 2.062a?
Not an problem for me, unless by going to the newest firmware would correct the average power out trouble.
Should I try doing that before anything else?

Bad finals or drivers perhaps?
I had a TS-430 once with bad drive transistors that worked fine on CW but with SSB no matter how much or little power out it was really distorted. So it exhibited somewhat different symptoms than the Orion.

TT made an exceptional rig, not counting this problem. I've never had a software enhanced rig before (if that's the right term). I've also never had to have anyone's hands but my own inside a rig to repair it in 45 years of hamming. Sending it away to have TT repair feels distasteful/wrong.

Any comments or thoughts are appreciated,
73

Looks to me you have followed logica steps to eliminate possible influences. Perhaps to exclude the rf feedback variable completely from the table you could use a dummy load to test for distortion.

I also know (my own failing experience) that some microphones are to flat in response and hence mic picks up the low frequencies which trigger alc way before you have reaches you optimal level. You could test this by an auio generator (pc based?) and pick up this sound with the mic. Set a audio frequency, change the level until alc triggers, move to next frequency and see if alc still triggers. Additional test could be to use the tx equalizer to attenuate the low frequencies.

In my previous experience using a studio microphone (heil) I had two issues: my voice audio presence included some low frequency which triggered alc. This resulted in a very low output for the total audio frequency. Second issue was that the mic output level was not high enough and actually needed external amplification to work well with the 565. The tx audio equalizer should help making the alc a bit more selective but I am not sure this action takes place prior alc...

On the mic settings; whats the mic gain value?

And yes, I would encourage you to upgrade to the latest firmware. It is a good quality firmware and very stable in operations. Simply upgrade, play with it and test the output. If no improvement found we need to investigate other potential issues.

Best regards, Onno

Thank you Mike and Onno,
I know it was a long-ish post so I did put a bit of thought in wording and laying it out, to be clear and cover the specifics as best I could.

One of the tests with the Orion was done with only a 50 ohm dummy load, power cord and assorted mics plugged into rig...ground attached then ground removed with each mic.
To perhaps see if RF getting in was the trouble.

I've now upgraded to version 3.032 Apr 7 2012 DSP 2.08b87.

No hitches doing so once I threw together a computer from the junque pile for win XP that is. I run Debian Linux on the ham shack main computer and couldn't figure out how to access the Keyspan HS19 USB to RS-232 cable with the software provided from TT.
That HS19 works fine business for FLdigi, rig cat and all else so far under Debian (testing repo) and with Arch Linux in another box too.

So as yet I have not had much time with the rig to see if upgrading the firmware has had the desired effect.

I'll get in some on-the-air hours, play with things and see.
Then will post to the group in a couple days, let you folks who are interested know how the average power out on SSB and ALC action is working currently. And maybe ask for more ideas if needed.

Thanks and 73
Paul

Just out of curiosity, what sort of "Average"power wattage reading were you expecting from the radio?

8869. Problem with subreceiver

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-17 21:10:05 UTC
From: Jose V. Gavila
Topic: 8869 Message: 8869

Hi all,

I am working on a Orion-I with a pretty deaf subreceiver. When I say deaf, I mean deaf ;-). In order to get an S-1, you need to inject close to 1 Volt on the antenna port.

I have tried to substitute all local oscillator signals with ones generated externally, but that makes no difference.

I see that the FL2 450kHz ceramic filter has DC applied to its input, which is not a good idea, as I have seen tons of ceramic filter failing on other rigs with a similar layout. But I doubt in this case the culprit is the filter, as injecting signal both before and after the filter produces a similar output.

Does somebody know which is the usual range level of signals on the 14kHz IF?. With 0.25mV at the antenna input I get about 70mVpp at the 14kHz output, which seems low.

I have read some old messages regarding a problem with the subreceiver PLL. Is that a common problem?

Please, any hint will be welcomed.

Regards,

JOSE

From: pa1ap
Topic: 8869 Message: 8870

I have no experience troubleshooting the sub receiver but first thought would be to inject signal directly at the rf stage (not the connector at the back) and move step by step closer to the last IF stage. Each stage would require a different frequency and level but it might help to isolate the faulty stage.

The other issue could be the firmware you are running.... If this is the new V3 firmware please make sure your have selected the original sub receiver instead of the new high end sub receiver. If the latter is selected the original sub receiver does not work. Just making sure....

Bets regards, Onno

In 2010 I paid $154 for the screen but do nave the labor charge. However,
the job looks about an minimum one hour.

> it might help to isolate the faulty stage.

Yes, I have already done that. It seems the first IF (at 45MHz) is deaf.
The other ones are reasonably alive.

> The other issue could be the firmware you are running.... If this is
> the new V3 firmware please make sure your have selected the original
> sub receiver instead of the new high end sub receiver. If the latter

> sure....

Yes, it is running V3, but it is correctly setup.

I think the culprit is the PLL section.

Thanks to a list member, I will soon get a replacemente subreceiver
board. I will try anyway to fix the other one or, at least, close the
circle on the bad area.

Regards,

JOSE

8875. Orion II Model 566 Version 3.033xa posted

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-20 21:52:50 UTC
From: John
Topic: 8875 Message: 8875

Just posted an update on the TenTec web page for the Orion II Model 566.

Version 3.033xa December 20, 2012
Added S-Meter Calibration
The procedure is downloaded with the 3.033xa update,
There is a start-menu link.
e.g. in Windows, click on Start, All-Programs, Ten-Tec,
OrionII Firmware Update, then look for the file
S-Meter 565 566 Calibration Procedure
Corrected Sweep alignment in LSB
Corrected SAF/Notch setting after power up.

The procedure is not necessary, but allows those that want the S-Meter readout to be as exact as they can get it, they can adjust it. It is actually adjusting the voltage level to the meter, e.g. when the software detects an S-9, it will look up the value in this table and use it to drive the meter. It does not adjust what is read by the software, an S9 is still an S9 in the software.

Thanks, and 73,
John Henry, KI4JPL
TenTec Engineering

I went to the TT WEB page and could not find anything referring to
"download" for the 566?

Where is it?

Thanks.

George it is under downloads along with the "S" meter cal procedure.

The update went fine. Something I noticed after the update is the "S" meter
Appears to be in fast AGC whether the AGC is set to Slow, Medium or Fast.

Topic: 8875 Message: 8882

Jerry, no, when you go to S1 in the menu use the multi knob to adjust the menu number for S1 to equal S1 on your mechanical S-METER, go to S-2 in the menu and adjust with the multi knob S-2 to equal S-2 on your mechanical S meter and so on until you are finished setting each level.

Note per instructions S-9+60 stays at 0.

I did put a calibrated signal in for S-9 and the Mechanical S METER ON THE RADIO reads S-9. So the Cal process appears to work. I checked it on 20, 40 and 80 and got S-9 on the cal signal.

Can you still go into the menu and adjust the AGC delays, etc.????

Maybe I will hold off until this issue is resolved.

That is probably not the intended action, but if it follows the signal instead of your receiver's AGC action, maybe that's not a bad thing? I suppose that would be unsettling for all of us who are used to the S-meter following what our ears are hearing in the AGC.

8888. New S-Meter calibration not follow AGC

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-21 15:01:56 UTC
From: George
Topic: 8888 Message: 8888

Duane;

I suspect after TT hears of the concerns they will revert the S-Meter back to AGC operation along with the calibrate firmware.

By the way, my O2 now indicates a S9 for 50uv input from my generator where before it indicated S6.

George W2YJ

Actually last week Paul Clinton gave me the info on
adjusting the S meter to S9 =50uv
and it worked.

8893. Re: [orion565] Orion II Model 566 Version 3.033xa posted

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-21 18:24:41 UTC
From: Luther Phillips
Topic: 8875 Message: 8893

Installed 3.033xa this morning. Did RAM CLEAR & Master Reset just to make sure everything was loaded ok. Then, did S-Meter scale adjustment procedure after restoring other custom settings. Ended up adjusting all values except S-0 and S-9+60. All my adjusted values ended up being lower than the default values listed in the procedure. Printed off a copy of the procedure and recorded settings for future reference.

Some observations:
1.Main S-meter action is now very fast, regardless of AGC settings

2.Sub receiver S-graph also seems much more "lively"

3.Main S-meter readings are affected by preamp on/off, but not by RF Gain settings

4.You can still adjust AGC settings as before. I mostly use PROG with the settings suggested in the manual: Hang=0, Decay=0.50, Threshold=0.50. I haven't noticed any difference in the sound or behavior of the receivers compared to V 3.029 using these settings.

5.Checking the main receiver with an Elecraft XG-2 on 20, 40, & 80, with 600 Hz roofing filter engaged, 50 uV reads S9+5 with preamp on, just above S-8 with preamp off. Readings very close on all three bands. 1 uV reads about S-3 with preamp on.

6.It is more difficult to discern readings especially on fast CW signals, but overall, I like the new action & behavior of the S-meters. YMMV, of course.

73,
Luther N4UW

With the new version installed, AGC Hang no longer has any effect. I'm not just talking about the S meter action - the AGC is clearly not working properly. It appears to be in Fast mode all the time, but I didn't take the time to see if the Fast mode parameters would control the action when in Slow mode. Adjusting the AGC Hang value had no effect whatever. Not ready for prime time!

Yep, it’s in trouble. My AGC’s are way out of whack.

It does sound like the slow AGC is acting like my fast AGC now. I have not attempted to change the original settings I had before the update.

It’s Christmas so I’ll live with it till they, TT, gets back to the shop.

Not a show stopper for me.

8897. Orion Blue Screen Display

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-22 02:06:50 UTC
From: hummerham
Topic: 8897 Message: 8897

Seasons greetings fellow Orion useres. I am looking for info, comments, and experiences from those who have upgraded their Orion to the Blue Display. I am thinking about doing that with mine and wanted to see what the thoughts were of those who have already done this. My standard display has developed a few lines accross it and am thinking it is time to upgrade to the blue display....hoping that will cure the problem of the lines. Any info and comments are welcome. Thanks and Merry Christmas to all.

73,
Butch...K3AFR

8899. [orion565] Opinion

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-22 15:41:41 UTC
From: Jim
Topic: 8875 Message: 8899

I have a question for those who have both the Orion/Orion II and the Omni VII. Other than the remote capability what do you like about the Omni VII over the Orion/Orion II?

I had been told the remote audio on the Omni VII is not that great??

I only have the Orion II and really enjoy the rig. Just wondering other than the remote if I am missing out not having an Omni VII here in the shack.

Tnxs de KE4WY Jim

HI Jim,

I have an Orion II as well as an Omni VII. I don't use the Omni VII remotely but for the most part like it for 6 meter use. Also, it is easier to work all 5 60 meter channels with the Omni VII than the Orion II. Other than that, on HF I prefer the Orion II. I have been thinking seriously of selling my Omni VII and eventually buying a 539. Another thing is I need the room on my operating bench. ;-)

73 & Merry Christmas,
Bill/K1FPV

8901. Re: Orion II Model 566 Version 3.033xa posted

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-22 20:51:19 UTC
From: John
Topic: 8875 Message: 8901

I went in to work today to measure the new version and the previous version AGC, and they measure identical. They sound identical. I did this on two units, and swapped the versions back and forth and could not measure or detect anything different in how the AGC operation worked. If someone has an exact measured difference that they can provide, then I will look at it some more.

But, just because the s-meter appears to work differently now does not mean that the rest of the rig is working improperly.

The AGC action is identical as measured in the lab and on the air.

Changing hang causes the hang time to change, measured, verified.
Changing decay does the same.
Both 3.033xa and the previous released version I measured identical.

If someone can identify an exact difference, then I can work on it, but the code was not changed in this area. So it should operate exactly the same.

Thanks, and 73,
John Henry, KI4JPL
TenTec Engineering

Hello John. I believe everything you've said regarding what you observed on the AGC action on your Orions. Now, I expect you to return the favor and respectfully admit that there's clearly something going on here that isn't right.

I assure you that I'm not your normal dumb-ass Orion owner - I've been at this game for over 50 years now and when I tell you that the AGC is NOT operating properly it isn't. I spent considerable time checking this out without watching the S meter. With the AGC parameters I use, I can certainly tell the difference between fast and slow AGC.

On my Orion II, adjusting the AGC hang parameter (let's just focus on SLOW AGC for now) clearly results in a variable hang and the S meter can be used to verify that. With the new version installed, adjusting the hang value made no difference whatever, no matter how large a value was set. I hope that's enough of an explanation of how the AGC is operating improperly. If you'd like me to try something else and observe how that effects operation, please let me know.

You might also consider that more than one of us observed exactly the same problem after installing the new version. In my case, falling back to the previous version resulted in a return to normal AGC operation.

I'm impressed that people want to use the S meter to tell something
about the AGC when in this version the S-Meter has nothing to do
with the AGC. I've measured the change in SNR over time with various settings in the AGC and they look exactly the same as in 3.029.
With on-off keying of signals the SNR changes over time
just like before. Expecting the S-Meter to show this
doesn't make sense when in this version the S-Meter isn't tied
to the AGC. I actually prefer the S-Meter being tied to the AGC
as it makes setting the RF Gain level easier for me, but having
the S-Meter show the right levels is more important to me,
so I'm not backing off. The AGC works just fine for me.
You'd never know it just looking at the S-Meter, but what
matters is the SNR. To me the AGC action sounds just like
the previous version and measuring the change in SNR confirmed it.

Hi Floyd,

You say that you have been at this game for over FIFTY YEARS.. Congratulations from myself and probably many many more hams around the world. As you know we are in the 21 century now and the comment you made which you wrote:

"I assure you that I'm not your normal dumb-ass Orion owner - I've been at this game for over 50 years now and when I tell you that the AGC is NOT operating properly it isn't."

So tell me Floyd, You must be the biggest DUMB ASS for making such a statement!

Since hearing that the S-meter is software defined, in the next version I would like the option
to be able to toggle the meter between the modes (perhaps by pressing in the Multi control ?).

Is that a possibility ?

8908. Orion II Model 566 Version 3.033xa posted

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-23 12:35:10 UTC
From: Sam W Jacobs CET
Topic: 8875 Message: 8908

John,

  No reports on the pops and clicks yet however first impressions are very positive. Basically
commenting on the new use of the S-meter and I love it this way much better. It would be nice
to toggle between the two modes (as I mentioned in an earlier message) but if I were to pick one,
this would be it ! Thanks.

73 !

From: George
Topic: 8875 Message: 8909

Where were the instructions for setting the S meter values? I lost them and can’t figure out on the TT page how to get the instructions.

Thanks

George W2YJ

You went into work on Saturday to do this ? That is dedication !
Thanks for checking. Now that I know this I will go ahead and install 3.033xa.
While I'm at it John, I'll give you a "pop / click" update using the new software
as I'm still on 3.031 for the O2.

Sent: Saturday, December 22, 2012 3:51 PM
Subject: [orion565] Re: Orion II Model 566 Version 3.033xa posted

I went in to work today to measure the new version and the previous version AGC, and they measure identical. They sound identical. I did this on two units, and swapped the versions back and forth and could not measure or detect anything different in how the AGC operation worked. If someone has an exact measured difference that they can provide, then I will look at it some more.

But, just because the s-meter appears to work differently now does not mean that the rest of the rig is working improperly.

The AGC action is identical as measured in the lab and on the air.

Changing hang causes the hang time to change, measured, verified.
Changing decay does the same.
Both 3.033xa and the previous released version I measured identical.

If someone can identify an exact difference, then I can work on it, but the code was not changed in this area. So it should operate exactly the same.

Thanks, and 73,
John Henry, KI4JPL
TenTec Engineering

Floyd and Jim,

If you guys think something is wrong, then I need to look at it some more. I may have missed something obvious or not so obvious to me.
Thank you for your inputs, it will help correct whatever is wrong.
Will let you know if I do find something specific.

Thanks, and best regards, and of course, 73

Click? Pop? What click and pop? And I don't even see 3.031 as an
available download...

I went in to work today to measure the new version and the previous
version AGC, and they measure identical. They sound identical. I did
this on two units, and swapped the versions back and forth and could not
measure or detect anything different in how the AGC operation worked. If
someone has an exact measured difference that they can provide, then I
will look at it some more.

But, just because the s-meter appears to work differently now does not
mean that the rest of the rig is working improperly.

The AGC action is identical as measured in the lab and on the air.

Changing hang causes the hang time to change, measured, verified.
Changing decay does the same.
Both 3.033xa and the previous released version I measured identical.

If someone can identify an exact difference, then I can work on it, but
the code was not changed in this area. So it should operate exactly the
same.

Something John and I are working on.
Version 3.031 was a special beta release to me.
Sorry, perhaps should have been in a private message. (no top secrets)

Thanks for checking. Now that I know this I will go ahead and install
3.033xa.
While I'm at it John, I'll give you a "pop / click" update using the new
software
as I'm still on 3.031 for the O2.

Subject: [orion565] Re: Orion II Model 566 Version 3.033xa posted

I went in to work today to measure the new version and the previous
version AGC, and they measure identical. They sound identical. I did
this on two units, and swapped the versions back and forth and could not
measure or detect anything different in how the AGC operation worked. If
someone has an exact measured difference that they can provide, then I
will look at it some more.

But, just because the s-meter appears to work differently now does not
mean that the rest of the rig is working improperly.

The AGC action is identical as measured in the lab and on the air.

Changing hang causes the hang time to change, measured, verified.
Changing decay does the same.
Both 3.033xa and the previous released version I measured identical.

If someone can identify an exact difference, then I can work on it, but
the code was not changed in this area. So it should operate exactly the
same.

Thanks, and 73,
John Henry, KI4JPL

Floyd and Jim,

If you guys think something is wrong, then I need to look at it some more. I may have missed something obvious or not so obvious to me.
Thank you for your inputs, it will help correct whatever is wrong.
Will let you know if I do find something specific.

Thanks, and best regards, and of course, 73

8917. Normal Dumb Ass Orion owner has question about upgrade

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-23 15:16:53 UTC
From: k7fd
Topic: 8917 Message: 8917

Hi All,

OK I uploaded the latest upgrade just to see what all the commotion is about...and I have all day to play with it, HI.

I put all the DEFAULT values in that were listed. Is that what I'm supposed to do, since I don't have a reference signal to generate so many db of signal.

Putting in the default numbers appears to make the S meter very 'HOT' and it bangs against the peg with strong signals. So what should I back off in that long list of numbers...

Lost in space,

John K7FD, Dumb Ass Orion Owners Club, Member #1

Yes, I went back to the TT page and couldn’t find the version you mentioned. J

Click? Pop? What click and pop? And I don't even see 3.031 as an available download...

You went into work on Saturday to do this ? That is dedication !
Thanks for checking. Now that I know this I will go ahead and install
3.033xa.
While I'm at it John, I'll give you a "pop / click" update using the new
software
as I'm still on 3.031 for the O2.

Sent: Saturday, December 22, 2012 3:51 PM
Subject: [orion565] Re: Orion II Model 566 Version 3.033xa posted

I went in to work today to measure the new version and the previous
version AGC, and they measure identical. They sound identical. I did
this on two units, and swapped the versions back and forth and could not
measure or detect anything different in how the AGC operation worked. If
someone has an exact measured difference that they can provide, then I
will look at it some more.

But, just because the s-meter appears to work differently now does not
mean that the rest of the rig is working improperly.

The AGC action is identical as measured in the lab and on the air.

Changing hang causes the hang time to change, measured, verified.
Changing decay does the same.
Both 3.033xa and the previous released version I measured identical.

If someone can identify an exact difference, then I can work on it, but
the code was not changed in this area. So it should operate exactly the
same.

Thanks, and 73,
John Henry, KI4JPL

Hi John,

Some questions:

- ORION or ORION II?
- current fw version
- previous fw version

- what kind of (RX) antenna do you use?
- which bands do you prefer?

73 Mark, PA5MW (owning both O (since 2004) and O2 (since 2012)

> Putting in the default numbers appears to make the S meter very 'HOT' and it bangs against the peg with strong signals. So what should I back off in that long list of numbers...

Hi Mark,

Orion II, purchased new in 2012

Was running 3.029
Now running 3.033

80 meter dipole at 50'
40 meter half wave sloper at 55'
3 element Mosley TA-33 yagi at 55' for 20/15/10

I operate primarly 40 meter cw, and to a lesser extent 20/15/10.

Hello John,

I may have jumped in too quickly here, since there's a brand new 3.033 fw version. I have no experience with that yet and have just read the first comments.

But let me share some AGC settings I currently use on V3.029 (OII)

Slow:
00.51s
10dB/s
01.00uV

MED:
00.12s
40dB/s
01.00uV

FAST:
00.04s
80dB/s
01.00uV

PROG:
0.08s
21dB/s
00.70uV

AGC setting is never above 92.

Above settings is what works fb with my small backyard RX antennas for 160m, CW only. However; the SLOW settings above are for Phone 80m ragchew and AM BCB.

From: Luther Phillips
Topic: 8917 Message: 8928

Hi John:

The "default" values are what appears on the screen when you go into the adjustment menu. Instead of rotating the MULTI knob to match what is on the procedure table, simply look at your S-meter for each menu line and adjust the MULTI knob so that the meter reading matches the menu line. Example: Rotate VFO A knob to highlight S-0, then adjust MULTI so that your S-meter reads S-0, then rotate VFO A to highlight S-1, adjust MULTI so that your meter reads S-1, and so on up the scale. Here are the counts I ended up with on my OII:

S0 0
S1 9
S2 14
S3 19
S4 23
S5 27
S6 32
S7 36
S8 42
S9 48
+10 55
+20 63
+30 73
+40 83
+50 96
+60 Leave at 0

All my readings ended up being quite a bit less than the ones listed on the table, and less than what was already on the menu screen.

I'll also add that adjusting AGC hang, etc. still affects the receiver on my OII as expected, but does not affect the behavior of the S-meter. I'm not detecting any issues with the AGC hang as some others have reported. I normally do not use any hang time, so it's not a big issue either way.

Can I lay claim to being Dumb Ass Orion Owner Club Member#2?

Good luck & 73,
Luther N4UW

Thanks for eveyone's guidance, looks like I'm set up now. S meter is definitely 'lively' I would say, not much dampening action but definitely does not affect AGC on my Orion II. AGC responds the same as it always did when switching from slow, medium, fast...

WOW John, that's not how I found my

S meter responding? I found it to be responding as if in fast AGC all the time independent of AGC setting.

Before the upgrade, in slow AGC, it would remain reading high and slowly return to 0 S units per the way I had my slow AGC set up with 3.82 seconds, 20db/s and 38.30uv.

8936. Orion II firmware upgrade

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-24 13:23:39 UTC
From: ki4ps
Topic: 4457 Message: 8936

Tried to upgrade my Orion II to the new firmware, and all failed.

My PC uses a serial card for the Omni VII, and the Orion II. My Eagle goes through the same PC via USB.

During the attempted upgrade the computer indicated it was not communicating with the Orion II. However, N4PY software would work, so I knew the radio's com-port was working.

After the radio would not connect I turned it off. When I tried to tune it on again, all it will do is light up the screen with the opening info " Ten Tec"

Power supply was disconnected, then later restarted, master reset was attempted. Nothing worked, so after Christmas a call will go out to TT. I'm sure they will say send it in. Nothing you can do to fix it.

The radio has about 200 hours on it if that.

Jerry, ki4ps

Jerry, another thing you can try is the RAM CLEAR. (hold VFO B LCK button while powering on) If that brings the radio back to life, ignore the "Battery Failure" message, answer the questions about RX-366, etc. Once you get to the main screen, then power down and do the master reset procedure again. If you get that far, confirm the radio is actually working before trying the upgrade again. I ran into the same problem with a friend's Orion 2 when trying to install 3.029 for him, but was able to eventually complete the install.

Good luck!

73,
Luther N4UW

Thanks guys for you ASAP input. YES! The Orion II is now back on line.

I found my problem was I grabbed an old USB-Serial adapter. It gave me a com-port, but was not communicating with the radio. I was trying the USB-serial unit because my serial card was not communicating with the firmware program. Only the N4PY software.

I found my new Prolific USB-Serial adapter. Reloaded my old version 3.029, and the radio came back to life.

What a Christmas Present. HI HI.

So, now that my body has calmed down, I might take the plunge and check out the new firmware.

AGAIN, thanks guys.

ok, let me get this straight, we are only referring to a problem in how fast the smeter is operating now, and NOT a problem in actual AGC action? Or is there still something amiss in AGC action? Someone claimed none of them made a difference, e.g. fast vs slow, and another said hang is not working at all.
I'll check it all out again when I get back to work on the 2nd.

Thank, and 73, and yes, Merry Christmas and Happy New Year to the Orioneers and the "dumbass club", lol, like that.
Take care,
John Henry, KI4JPL

John;

The AGC action appears to be working fine on the new (S Meter calibration) firmware but the S Meter is like it's following the fast AGC. Like a meter on steroids, hi.

If I had my druthers, I'd like the S-Meter to follow the AGC like the previous firmware version. Maybe that can be accomplished and retain the current firmware changes?

But to re-iterate, the AGC is working fine.

John, George is correct...AGC is fine. But the meter needle moves like it is always on 'fast AGC' no matter whether you are switched to fast, med, slow, prog...

Subject: [orion565] Re: Uploaded, calibrated, happy

ok, let me get this straight, we are only referring to a problem in how fast
the smeter is operating now, and NOT a problem in actual AGC action? Or is
there still something amiss in AGC action? Someone claimed none of them made
a difference, e.g. fast vs slow, and another said hang is not working at all.
I'll check it all out again when I get back to work on the 2nd.

Thank, and 73, and yes, Merry Christmas and Happy New Year to the Orioneers

and the "dumbass club", lol, like that.
Take care,
John Henry, KI4JPL

From: Mike Congleton
Topic: 8930 Message: 8943

The first time I installed 3.033 nothing AGC related worked correctly. Pushing every setting to the stop made no change what-so-ever in the response to the AGC so I rolled it back to 3.029.

I sat back and watched all the conversations on this reflector, and after reading many people were happy with the update, I decided to try again. After updating the Orion a second time with the new firmware all worked fine; AGC action followed the settings (at least to my ear anyway...). I will have to say I don't remember if I did a complete reset of the radio the first time (master reset and RAM clear) - I may have just done the reset. This time I made sure to do both.

However, I just do not like the nervous waggling of the S-Meter - I guess I like the meter action to follow the AGC so I went back to 3.029. I think this update will be a matter of personal preference - they both seem to work as intended.

8944. New 3.033xa Update. Works great. I have suggestion or request.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-27 18:21:33 UTC
From: John_Tn
Topic: 8944 Message: 8944

I have just installed the latest update without any problems. I do also notice that AGC rate has no effect on meter response but AGC IS working correctly. The meter now is very accurate. It is not the end of the world for me if the meter does not follow AGC rates, However if it is possible to add a menu option to allow the user to:

1.Follow AGC
Or
2.Meter hold time settings to slow meter response that would be great. If not I would rather have the accurate S-Meter than one that follows AGC.

What I do really like with the new update is the AGC threshold level now has no effect on S-Meter reading witch used to drive me crazy.
Thanks for the hard work and these useful updates.

John/KC2QMA

8945. 3.033xa Update

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-27 19:15:33 UTC
From: wa4oss@netzero.net
Topic: 8945 Message: 8945

I have not updated my firmware. I wanted to read the opinions of several users prior to updating. At this time it seems to me that the update is functioning as intended.

Now, why would it be desirable for the "S" meter to be in the agc loop? The "S" meter should accurately indicate the signal strength at the antenna terminal. This is something few radios do. The OMNI VII and the Flex radios seem to have realized this can be achieved.

8946. RE: [orion565] 3.033xa Update

Every radio I've had (Drake, Collins, Heathkit, Icom, Kenwood, etc.) have all had S meters that moved differently according to the AGC setting; when set to FAST AGC, the meter moved fast, when set to SLOW AGC, the meter movement had a slower decay...

Exactly - S-meters on most radios follow the AGC because this is the easiest way to make a meter show something that resembles signal strength. If you stop and think about it, it's not actually showing you the signal strength - at least not directly. It's showing you how the receiver is responding to the strength of the signal. So, you set it for slow AGC and the signal is fading in a faster manner, and that will not show up. The signal drops, and you see the needle slowly fall, when, in fact, the signal was gone instantly. The big question is, do you want an S-meter that shows you the signal strength (or a more reasonable facsimile of it) or do you want an S-meter that shows you what the AGC is doing. At least, that's what I'm hearing discussed here.

I see there are 2 opinions on how people like to see their S-Meter respond. Now as for me I am only interested in the signal level at the Antenna connector or receiver front end so the new Update works great for me. Now having said that I can also understand how some users would like to see the S-meter track the AGC.
I think it would be a good idea for users to have a menu Option to set the S-meter Pre or Post AGC.
Like I said I like the new update because it makes the S-meter more accurate to read the signal strength at the front end of the receiver rather than "Post" AGC.
Now if we really want to get picky how about the Sub-receiver S-meter also have a numerical value just before or after the bar graph?

Before I list this on QTH or Eham I thought I would offer it to someone on the reflector.

Absolutely Mint Ten Tec Orion II with optional Antenna tuner and optional 1.8, 600 and 300 filters. Have original Box, manual, power cord and package of goodies.

$3050 shipped and insured. This unit is in great shape. No dents, scuffs or scratches.

KE4WY Jim

John, Ideally when the AGC is set to slow and a strong signal unkeys, the meter should fall slowly. On Med it show fall a bit faster. On fast it would fall immediately (like it is right now - the default that can't be changed in this new 3.033xa version. All that needs fixed it how fast (or slowly) the meter falls. I like the new change.

In a menu option, you could have the S-meter either 1) follow the AGC setting 2) always fast or 3) work as previous versions and indicate the amount of RF Gain reduction is used.

I know it was always tough giving someone a signal report because I would have to turn the RF Gain to 100 and take off any other attenuation I might have on. Now all I have to do is look at the meter, cheers !

73 !

John,

Thanks for the new update!
I really, REALLY like the new meter action!

The AGC is working fine, as usual.
The meter is working great too!

I much prefer the new meter movement. I usually ride the RF gain all the time and I really disliked how the old meter behaved. I also disliked the accuracy of the old one. (Mine showed a S8 signal as S9+20)

Thanks!!!
Frankie

John Henry......
Any chance a similar upgrade will be made available for the 565 Orion.....? Just wondered....it would be welcome.

Thanks for all you do for us 'dumb asses'.....lol..... Happy New Year....

I agree, it's nice to have the meter action now independent of the RF Gain control...very nice indeed...

I haven't tried the new version yet but it seems like what is being asked for is a menu selection for S-meter action similar to some watt meters, I.e. a selectable peak or average, or peak hold with decay, etc. optionally a "meter damping" setting. The nice thing about a slow meter action is that it gives your eye time to make a reading on voice sub, otherwise you only see an accurate reading on constant carriers. So a slow or "averaged" response is more desirable in my view.

More to the point, I'm not sure that all the banging around the needle does now is good for the meter. On mine, it returns to zero at such a clip, it almost bangs against the stop. This is especially noticeable when tuned to a strong CW signal. At least on 'slow' AGC it used to come back down gracefully :)

I think it would be a good idea for users to have a menu Option to set the S-meter Pre or Post AGC?
Or meter Peak & Average option?
That way everyone is happy.LOL

Thanks for the update works great for me.

Let me chime in with my opinion on the

S-meter and new 3.033xa firmware.

I like the new firmware but would rather the S-meter revert back to its previous operation, which is, following the selected AGC action.

Right now my S-meter is on steroids, hi. J

Thanks for everyone's inputs. It will only help to make the product better.

At least I am glad to hear the "action" of AGC is correct. Phew, that is a good bullet dodged.

SMeter action, will look into it. A menu item doesn't seem unreasonable, or a menu item for amount of delay per agc setting. Then, if you don't want any delay, set it to a low value, and if you want delay, set it to a high value, separate for all AGC settings. So you can tailor it to your liking. Not sure how easy this will be to do, but would solve it for everyone, defaulting to "same as AGC" value settings, I guess. Or a single menu item with "0=follow AGC", or a single value 1..10 for all agc settings. One menu item. Will have to play with it a bit and see what makes more sense. Worst case, we will leave this release as it is for maybe a month and see if anything else pops up so we aren't putting out the "release of the week". Hope that is OK with everyone. Lots of things to get done on top of this.

Regarding 565, the smeter calibration procedure has worked in the 565 since version 2.064??? or something. So, if you are running any of the V3 firmware, you have it as well. Not the SMeter before AGC fix, but the smeter value adjustment.

Remember, this new smeter calibration only calibrates the voltage level given to the smeter once the DSP has determined the signal level. It does not change or calibrate what the DSP calculates as an sunit signal strength. I would rather you get the calibration procedure for that from Paul in service, requires signal generators, pot adjustment, etc. THEN you could do the final smeter meter calibration to make it read out what you have already calibrated in HW. For the most part, the actual hardware calibration is not necessary, unless you have had damage, and then, service really should be the one to look at that.

I'm out of office until January 2, but will check back in from time to time for any real necessary answers. Usually, you all answer yourself, but this one needed some of TenTec's inputs.

Take care, and 73,

8961. New 3.033xa Update. New meter behavior / opinion.

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-28 14:21:26 UTC
From: Frankie
Topic: 8944 Message: 8961

I like the way the meter works in the new firmware.

Seems like there are 4 meter qualities affected with the new firmware.

1. Meter is now independent of RF Gain control.
Big improvement. I really like the new meter action! PLEASE, PLEASE don't take this option away!

2. Meter is not tied to AGC
Big improvement. I like how it is now, showing actual signal level, independent of AGC.

3. Meter movement speed. (its fast)
I like it now, however it could use some "decay" value in my opinion. I would rather have no decay than too much though. I am almost afraid to say anything fearing it will revert to something I wouldn't like quite as much. I like it well enough that no further changes would be quite OK with me.

4. Accuracy improved. (excluding AGC induces discrepancies)
Big improvement. There is a huge improvement with this firmware. With the old firmware mine was way off (S8 showed +20)

Thanks for the changes!!
Frankie

Hi Frankie,

Whatever we do, we (hopefully) wouldn't take a step back.
It's independence of RFGain is a HUGE improvement.
Maybe add a dampening to it's decay action so it doesn't swing so fast, user definable would be nice, but, well, will see in a week or two.
Worst case, it is what it is today, and no changes, but I don't feel comfortable with that answer completely myself. But, then I have to get authorization from Jack to improve it.... he runs the company and pulls the final strings.

Thanks, and 73,
John Henry, KI4JPL

I want to thank you for the hard work you and the Ten Tec team does for us. The fact that users are able to communicate with engineering IS exactly why TEN TEC products are the best money can buy! Try that with the foreign makers and it would be like yelling into an empty room with the light turned off.

The Orion keeps getting better and better

I also recently received a Regal #707 Microphone and am amazed at how good it sounds without any audio processing, It also looks great in the shack. This Microphone is a great match with the Orion and with the new lower price you just can't beat it. Give this Mic A Try!

Hi Barry,

Will look into it, but, one of the drawbacks with changes in the 565 is that it has been evolving and added to MANY years after it was taken out of production, and in doing so, it is running up to the edge in code space. We are improving several areas of the Orion 565 right now, but need to keep constant look at the linkers report on amount of space left. I don't want to get into different versions having different capabilities, would not be easy to maintain.

Thanks, and 73,
John Henry, KI4JPL

8968. RF output Orion-II

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-28 20:32:12 UTC
From: NE7X
Topic: 8968 Message: 8968

I am having an issue with my Orion-II, when the radio is not used for two or more days, after I first turn it on, it will only put out about 8 watts. Then after about 30 minutes, it will put out full 100 watts. It will continue putting out full power from this point forward until I turn it off. If I turn it on in less then about 24 hours it will have full RF output power. However if I turn it on after two or three days, it will only put out 8 watts again, then after 30 minutes or so it will put out 100 watts for the rest of the day.

What I suspect is a bad electrolytic capacitor. After the capacitor slowly fully charges, the capacitor will stay formed and the radio will put out full power, and will say formed after I turn the radio off for about 24 hours.

The question now is what capacitor could it be? Anyone troubleshooting suggestions?

Thanks. Thomas NE7X...

Then after about 30 minutes, it will put out full 100 watts. It will continue putting out full power from this point forward until I turn it off. If I turn it on in less then about 24 hours it will have full RF output power. However if I turn it on after two or three days, it will only put out 8 watts again, then after 30 minutes or so it will put out 100 watts for the rest of the day.

What I suspect is a bad electrolytic capacitor. After the capacitor slowly fully charges, the capacitor will stay formed and the radio will put out full power, and will say formed after I turn the radio off for about 24 hours.

The question now is what capacitor could it be? Anyone troubleshooting suggestions?

Thanks. Thomas NE7X...

Kirby K7EC

Thanks for the reply to my query. I did perform a reset after doing the firmware upgrade, so I think we can rule that out. I suspect a electrolytic capacitor, this is a common characteristic of how one would act when going soft. I think I will take your advise and "shot-gun" and replace all the caps on the A9 board. I will post my finding here after doing so in the next week. I will also check/replace the backup battery.

Thanks, Thomas NE7X...

Updated my Orion II yesterday. All went well, and I must say I now see S-meter readings that are not super high. Before the upgrade I was seeing a lot of stations pushing 40 over. I knew the S-meter was over inflated.

I run my RF-gain about 60% most of the time. Never did like radios that moved the S-meter up as you reduced the RF-gain. I know the reason way it did it, but never liked it.

As for the audio, that is something I'm experiencing also. Seems to be a notch better.

PS: My Eagle and Orion II just keep getting better.

That was me, John. We are still working on it.
It only affects the REAR audio output (coming from the RCA jack).

When a strong signal is received AND the Audio Notch (AN) is engaged you
will hear pops and clicks coming from the rear audio jack.

That's what John and I were working on. He was adjusting the code, I was his
tester. As of right now, I believe the pops and clicks are still there. The .ruf
files were alpha test and not available on the download page.

I also uploaded an audio file to the file section so you can hear the sounds.

8982. Possible BUG in DSP Filter Length. Lets see if you can reproduce...

Yahoo group: orion565 (2009 — 2013)
Date: 2012-12-31 12:15:58 UTC
From: kc2qma
Topic: 8982 Message: 8982

I found what seems to be a possible bug; I have been able to do this in OS version 3.029 and the latest version 3.033xa. I just want to see if anyone else can reproduce this.

Sometimes I like to soften the receive audio by lowering the DSP filter length in the filter menu. It makes listening for long periods a little less fatiguing on my ears.

OK so here is the problem, if I lower the DSP filter taps to below 47 and then adjust the Bandwidth down and then back up I get audio distortion. Now once you re-adjust the DSP taps the audio clears back up.

So here is how to test and see if others can reproduce this.
1. Tune to a good signal. It does not matter what mode (LSB, USB or AM) however a phone signal will be the best. CW may be hard to detect.
2. Go to the FILTER MENU then move VFO A to highlight "DSP Filter length"
3. (DSP Filter Length) Adjust the taps down to 32.
4. Then exit menu.
5. Adjust the bandwidth control all the way down, then back up to a normal setting anywhere from 2000 to 4000.
Do you here audio distortion?

Now don't worry you can clear the distortion by just going back to the DSP Filter Length and turning back up to 199.

Now this is not a big problem but may indicate a small bug that if corrected May or may not improve the overall receive audio?

(Now some may say like the old joke "Doctor it hurts when I do this" and the doctor says "then don't do that")

Anyway just wanted to see if anyone else can recreate this.

That said I LOVE the new meter update works AWESOME!

73, KC2QMA
HAPPY NEW YEAR!

recent update for the for the Orion 565 is 3.032. I did your test and
my audio did not distort. If you have a Orion565 and you are updateing
with Orion 566 firmware that may affect your Orion565 adversley..

If you a Orion 566 it is obviousley a bug.

I have a Orion 1 565 with Vers 2 Mod

Jim,
What mode are you using? I had a similar problem and realized I was
listening to SSB in the LCW mode. It sounded ok but the frequency was off.

Happy New Year

I get this on my 565 v3.032. Dropping the filter length to minimum 32 then listening to a voice signal if the bandwidth is reduced and then returned to normal, actually I think it needed to go above 2400Hz then the audio went all weird and changes dramatically with further changes in the bandwidth control. Just initial tests here, nothing specific.

I also find listening with the smoother filter slope to be much less fatiguing.

I also note the SAF does not seem to survive power cycling. The display still shows it active but it is definitely out of circuit until cycled around with the SAF button. Not tried to see if it does that with the notch function instead of the SAF.

Cheers
Martin, HS0ZED

I don't get this at all on my 565 v3.032 - sounds fine with 32 taps and varying bandwidth.

I think the SAF power cycling is a known minor issue.

After you reduced the taps to 32 you must next turn the bandwidth all the way to the minimum 100Hz, then increase for the strange audio. It sounds like at certain bandwidth setting once this starts to happen the bandwidth is changing from that displayed to a much wider value, like about 4000Hz and then at the next step dropping back where it should be.

Martin, HS0ZED

Yes - now that I reduced it all the way down to 100hz and then increased,
the audio is totally screwed up - sounds scratchy/thin/distorted.
Restoring the taps to 199 and power cycling hasn't restored normal audio.
How do you restore normal operation after this little trick?

From: Martin Sole
Topic: 8982 Message: 8999

Ooh-er, now that's a bit worrying. Mine resets once the filter taps are reset to 199.
Master reset?
Call Ten-Tec?

Hopefully you have it fixed already. I would classify this as a minor inconvenience, like the SAF issue, but for the fact you seem to have made it more permanent.

Martin, HS0ZED

Yes - now that I reduced it all the way down to 100hz and then increased, the audio is totally screwed up - sounds scratchy/thin/distorted.
Restoring the taps to 199 and power cycling hasn't restored normal audio.
How do you restore normal operation after this little trick?

I still wish we had more display color control options.

I would love to be able to set my own background color, color for the main and sub receivers, lower menu, sweep colors, etc. I don't see how this would be hard to do.

I realize this has nothing to do with how well the ORION II operates, but it sure would make this operator happy.

T*T could also incorporate different Fonts into this.

I was also thinking that a clock would be nice since it "does" have that capability. That way you could also have a turn on / turn off time set and timer off (30/60/90/120) And while I'm on a roll, how about a security lock. Like entering a 5 digit code (if enabled) to unlock the radio. This would prevent unauthorized operation (or unauthorized transmit).

How about incorporating Julius's (W2IHY) 8 band EQ for audio ? I think Flex is doing that now as well as Kenwood (BTW, look for a new product sometime this year from Julius Jones, a new 16 band (?) EQ incorporating his EQPlus into it).

I have a few other ideas too but don't want to overload the reflector.

HAPPY NEW YEAR TO ALL from Butler, Pa.

73 !

From: James Skalski
Topic: 9002 Message: 9002

I like the meter action in the latest upgrade. I like being able to see the level of background noise and weaker signals in the passband.
My volume control doesn't change the S-meter setting and I feel that the AGC shouldn't either. On the other hand some feel differently. To accommodate the most users, I suggest that it should be a menu option to have the S-meter react to the AGC setting. This is only a preference and there is no right or wrong. I don't need anyone to brow beat me telling me what I should like ore prefer :) There is no need for a D.A club number :)
No need to bristle when you give an opinion.

9003. Display color, clock, recorder.....

Yahoo group: orion565 (2009 — 2013)
Date: 2013-01-01 17:22:55 UTC
From: Frankie
Topic: 8972 Message: 9003

There are 3 things I would like to change. Minor, but they would make the Orion nearly perfect for me.

1. The display color choices are not what I like. I only like/use Color 4. The only other choice that I even like is Color 3 however it seems to flicker so I don't use that one. So, I too would like more display options, especially ones with a black background.

I think this would be an interesting Poll for this group. "Which LCD Display Color do you use on the Orion II?"

I came from an Icom IC756 PRO II several years ago and I do miss 2 options from that radio.

2. I would like to have a clock displayed. Yes, I have other clocks in the shack but I find it handy to have one on the radio display.

3. I really miss having a recorder built into the radio. I dont need one to play back on the air, I can do that with the pc if I need to. I am talking about an audio recorder that will play back just the audio.

Often times when listening to a very weak station making multiple QSOs I could record the station when he gave his call sign. I would then play it back on the Icom several times allowing me to figure out what the call is or just double check that I got it right the first time. Or..... listening to a group on 75 meters the entire group gives their calls within a 3 second window. I could play that back, writing down each call. I have adapted using other methods such as Audacity on the pc, a mini cassette recorder, or an Olympus MP3 recorder, but each of these has its drawbacks. None are nearly as convenient to us as the Icom method was.

I really like the Orion II.

I have had it for quite some time and would not do an even swap for ANY radio. (unless I could sell the new radio and buy a couple more Orions to use!!)

Here is my wish list.

1. S meter follows the AGC.

2. Real time band scope not 1 second behind.

Gosh, that□s about it as I□m very pleased with my O2. The display is full as I can see it and don□t know where a clock would be placed? I would say that the main frequency readout could be made a bit smaller, just saying.
